

## Star Wars Theme 2.0

### Installation

1. Extract the *StarWars20.zip* file into a temporary directory, using an extractor that can handle long file names, for example WinZip. ” <http://www.winzip.com> ” now you should have 2 folders, and 5 files.
2. Move to *logo.sys* file to the root directory, (c:\) and move to other *logo\*.sys* files to your windows directory (c:\windows). Don't forget to make copies of your *logo\*.sys* files.
3. Move the Star Wars Theme 2.0 directory and the 2 remaining files (this readme file and the *Star Wars 2.0.Theme* file) to your themes directory (C:\Program files\Plus!\themes).
4. Open the *windows\system* dir and move the 7 screen-saver files to your windows\system directory (c:\windows\system\). Read the screen-saver readme file for more information.
5. Double click the *Star Wars 2.0.Theme* file and may the force be with you.

### What's new?

New features in this theme is, as you can see, a whole new wallpaper and this is one of the coolest I have seen. I have also changed most of the sounds and some of the cursors. Also new in this theme is that I have found shutdown Logo\*.sys files. But I am still looking for a better logow.sys file.

I am looking for a Star Wars font to have in the next upgrade of the theme, and if you know about a freeware Star Wars Font, please drop me a E-mail.

If you have any comments, just drop me an E-mail @:
