

SAS/SHARE[®] software was created for multi-user environments, such as sales management or purchasing, in which users need concurrent access to information. With the software, two or more users can gain concurrent access to a SAS data library, data sets in the library, or observations in the data set. The SAS server, a control program, coordinates all requests to ensure maximum concurrency and security. The software complements SAS/FSP software, a product for full-screen editing, browsing and query. Using SAS/SHARE and SAS/FSP software, a customized data entry and access system can be created for an entire company, end user departments or any group that needs access to information.
