Version 1.01

Bugs corrected
• Fixed a problem in the plug-inthat prevented a correct preview of the selected objects when a text (not converted to paths) was on the screen.
• "Guides" objects are now ignored by the plug-in (were considered as normal objects).
• In colour separation, fixed a bug that previously didn't take in account when a colour was unchecked in the list, querying for a sheet in any case.
• Again in colour separation, fixed a PowerMac version bug in the Server (68K was correct).
• Some drivers (esp. Houston-derived) were corrected.

New features
• In the plug-in, the user is now prompted for the name of the file sent to the Server: the default is <document title>.out (formerly this was the name automatically assigned to the job).
• A new item in the Filter menu is added beside CutXtra: the Scale item allows the "real-size" dimensioning of a drawing:

he user can choose to scale the selected drawing by percent or giving it an exact size: if the Prop. button is checked, changing the width changes the height too and viceversa. A useful feature is to select a reference object, give it an exact size and press Global to extend the scale to all the drawing based on that object.
• Now the drawing in the Server appears on the screen at acknowledge, not only when the user starts plotting.
• The size of the drawing is shown in a box in the Server dialog.
• The Notes button in the Server is hidden if there is no note from the drawing program attached to the data.

Coming soon…
• Automatic job merging in the Server (to optimize colour changing).

- Path optimization to minimize tool travel.
- Job report module.
