

Version 1.02

Bugs corrected

- Fixed a problem with origin in some HP-GL plotters.
- Fixed a problem with a too low accuracy in small curves.

New features

- In both the plug-in and the server, a spinning cursor indicates activity.
- A new button in the plug-in plotting window allows a remote user to override the parameters acquired from the Server: the window is nearly the same that the Params config dialog in the Server. In the case the user changes something (actually, the simple clicking of OK in the dialog), when the Server acknowledges the file warns that parameters were modified, so the user connected to the plotter can check if everything is correct.

he parameters are overridden only the first time the file is acknowledged: subsequent cutting will be done with the default.
