Version 1.1 (January 1996)

Bugs corrected
• No big problem was corrected in this release.

New features
• Two new utilities were added to the plug-in set:

X-Height:

his filter works on a selected text object (not on single characters selected in a text!). It calculates the "real" text height (i.e. the height based on capital letters) and allows to scale the text proportionally. Please note that all the information about the font is taken from the tables inside the font itself: some small inaccuracies can exist. This plug-in doesn't work with FreeHand (who knows why?).

Complexity:

his filter calculates some useful data on the objects selected (paths, not text). The perimeter and area are shown, and a relationship between these is taken as a complexity index for the drawing. Furthermore, the unit for all the plug-in suite can be set, and is reported also in the CutXtra plug-in.
