Version 1.2 (March 1996)

Bugs corrected
• Finally got Illustrator 6.0: corrected a small bug that prevented all plug-ins to work under this release;
• Corrected a small bug that crashed application if Start Immediately function was selected with files already present in the folder;
• The X-Height plug-in now tries to use ATM™ on Type 1 fonts (if it's installed): this increases accuracy;
• Discovered a FreeHand bug: rectangles with rounded corners are incorrectly reported as normal rectangles: the way to avoid it is ungrouping them just after creating. Macromedia has already been contacted about this.

New features
• There's now the possibility, for the Server, to avoid redrawing all the data: this way, the "step-by-step" effect is lost, but normal working is faster.

Other variations
• The software is now marketed under another name: please check "More info…" in the first chapter.
