Chapter 1

tweakwb

1.1 TweakWB - Content

TweakWB 1.6 (6.2.2000) A commodity to change Workbench 3.5 internal settings, simple "deficons" replacement and handy drag-n-drop MWB icons converting tool to the new 3.5 icon format.

1.2 TweakWB - Installation

Installation

- 1) copy the content of the "env/" subdirectory into "ENVARC:"
- 2) copy the catalogs into LOCALE:Catalogs/ directory.

3) copy the help files into LOCALE:Help/ directory.

4) copy TweakWB file to your "SYS:WBStartup" drawer, run it,

select desired features. Save and reboot your Amiga.

Requirements

```
- Kickstart ROM 3.1 (V40)
```

- Workbench 3.5 (V44)
- 68020+ CPU

Known incompatabilities

- turn off MCP's "WBGauge" patch

- remove "WBStartup+" utility (it has problems with WB 3.5)

- if you experience recoverable alerts (bad WBStartUp message),
- remove MCP completely from your startup-sequence.

1.3 TweakWB - Features

Features

• Images to FastRAM (RTG Mode)

Enables RTG icon mode (i.e. icon images in FastRAM). This will set the type of the memory which Workbench allocate for image data. The default is MEMF_CHIP, TweakWB change it to MEMF_PUBLIC. Only for graphics card users!

• Drawer notification

If enabled, Workbench will be notified of changes in every "Show all files" mode drawer. Every time a notification arrives, Workbench will reread the drawer. Play with this feature a bit and you'll find out why we canned it.

• Disable volume gauges

For those who don't like the Workbench volume fill gauges, here's your chance to disable them. Check this option to disable the gauges. Note that this feature does not affect volume windows which already have the gauge attached. For those windows, you have to close and reopen them to get rid of the gauges once they have been disabled. ATTENTION: please really close all WB windows before changing this option, otherwise WB could hang.

• Use datatypes identification hook

Enables default icons identification via datatypes descriptors. Put "def_XXX_YYY.info" (e.g. "def_docu_amig.info" for amigaguide database) icons into "ENVARC:sys/deficons/" directory. XXX stands for SUPERCLASS ID (e.g. "docu" for documents), YYY stands for SUBCLASS ID (e.g. "amig" for amigaguide). There is a fallback to superclass, if exact SUPER_SUB icon cannot be found. • WB copy buffer length

This will set the maximum number of bytes the file copy code will use. Default is 64K since this is the largest contiguous block of data certain unreliable SCSI controllers can handle without choking. Note that the copy code is smart enough to scale back its memory requirements if there is less available than expected.

• WB maximum filename length

Set the maximum length of a file/drawer name supported by the WB. Useful for filesystems as SFS. Note that the standard FFS can handle only 30 characters, so default length is 25 (substract ".info" postfix). The maximum length supported by dos.library is 107 characters, hence WB maximum is 102 characters.

• Don't show GUI at startup

Disable GUI popup at the next start. Useful for WBStartup drawer.

TweakIcons

=========

This small drag-n-drop window is intended for fast and easy icons converting from old MagicWB 2.0 style (first 8 colors, 3 bitplanes) to the new OS 3.5 style color icons (chunky image, dynamic palette). In addition, you can clear or set icon border on the individual basis or even delete whole ".info" file (attention, be careful!). Icon size will be optimized (smaller in size than old MWB icons!), but note that old planar images will be DROPPED! Don't use this tool if you still need old style OS 2.x/3.0/3.1 icons.

1.4 TweakWB - Usage

Commodities Exchange

TweakWB is a system-conform commodity. You can fully control it by the Commodities Exchange panel (SYS:Tools/Commodities/Exchange).

ToolTypes

========

CX_PRIORITY=<-128..127>

All commodities tools receive input events through prioritized queue of handlers. This means, the higher the CX_PRIORITY value, the sooner a tool will receive an event.

CX_POPKEY=<hotkey>

You can invoke the TweakWB preferences editor with a hotkey combination. The default is "ctrl alt t", which means you need to hold down the [Ctrl] and [Alt] key and then press the [T] key to invoke the preferences program. For complete description of the hotkey syntax, see your AmigaOS manual.

CX_POPUP=<YES or NO>

If you want TweakWB to open the TweakWB preferences window immediately when it is started, set this tooltype value to "YES". Otherwise, leave it as "NO".

DONOTWAIT

The Workbench will process this tooltype when TweakWB is started from the WBStartup drawer. It tells Workbench not to wait for TweakWB to exit before launching the next program it finds in this drawer.

TOOLPRI=<-128..127>

This is another tooltype the Workbench will pay attention to. It defines the task priority which TweakWB will have assigned when it is launched.

STARTPRI=<-128..127>

This tooltype defines the order in which TweakWB will be launched with the other tools in the WBStartup drawer. The higher is this value, the sooner it will be started.

PATTERN=<full_path>

If you want to have a datatype picture as the TweakWB preferences window background pattern, enter full path to this picture.

DISABLE_DEFICONS=<NO or YES>

If you really need disable TweakWB's deficons functionality, set this tooltype to "YES". Defaults to "NO".

Other tooltypes and window positions are changed automatically via the TweakWB preferences window.

1.5 TweakWB - Full history

Full history

TweakWB 1.6 (6.2.2000)

- removed CyberGraphX check for FastBlit users

- minor changes & optimizations
- swedish localization

TweakWB 1.5 (10.1.2000)

- fixed enforcer hits when opening TweakIcons window and related sizing problems

```
- TweakIcons remembers its window position correctly, now
- new french and spanish localization
TweakWB 1.4 (26.12.1999)
- fixed wrong window position after iconification
- added ROMIcons converter (old style 16 color icons)
- added NewIcons converter (+ optimalizator)
- maximal filename length should be 102 chars instead 103
  (terminating null counts)
- more validation checks
- added check for RTG system ("Images to FastRAM" option)
- minor fixes in catalogs & docs
- minor speed optimizations
- ATO localization
TweakWB 1.3 (22.11.1999)
- fixed problems with button-images overdrawing
- added tooltype 'DISABLE_DEFICONS=NO/YES' to bypass TweakWB
 deficons support completely
- lower memory requirements in sleep mode
- added deutsch catalog
- fixed another minor memory leak
- added hidden window sizing gadgets
- now preferences window always popups on frontmost public screen
TweakWB 1.2 (14.11.1999)
- added default icons fallback
- added icons delete tool
- added tool-menu hotkey (RAmiga + "*")
- fixed minor memory leak
- improved GUI
- tweakwb.cd file changes (catalogs bumped to version 2.0)
TweakWB 1.1 (09.11.1999)
- fixed bugs in hotkey activation
- added second hotkey for TweakIcons window
TweakWB 1.0 (07.11.1999)
- first public release
```

1.6 TweakWB - Future versions

Future

installer script
better deficons hook

- bugfixes?
