

Sample use of my Application Menu scripting additions. Drag and drop a AppleEvent-aware application on top of this droplet; the application will be launched and brought to the front, and all other running applications will be hidden.

Note: This isn't 100% reliable. It works with some applications (HyperCard 2.1, MPW 3.3, MacWrite Pro) but fails with others (ResEdit 2.1.1). I'm not sure why.
