PMTclShell ver. 1.0
Tcl shell for OS/2 Presentation Manager

PMTclShell is a graphic shell for Tcl programming language. In fact the main window is made up by a line for the text input (in the lower part of the window) and by a multiline control for the output display.
PMTclShell is interfaced with a character shell (usually `tclsh.exe`) to which it sends the command inserted   in the proper input field and by witch reads the interpreter's answer.
At present PMTclShell 1.0 has been tested with the use of tclsh.exe enclosed in the Tcl7.5 package of Yves Paindaveine (yp@osf.org).

Advantages in comparison to a character shell:

- A better interaction with users
- Cut&Paste
- Creation of the message queue. This permits the execution of Tcl commands (or its extensions) using the graphic interface. It is possible, for example, to execute an `exec e.exe` command to run the OS/2 graphic editor, or one can create a new command (loading it with the command `load`) which produce a window and uses the Win services. This would be impossible with the mere use of tclsh.exe.

Installation
° Unzip **pmtclsh.zip** in an appropriate directory (for example: `unzip pmtclsh -d \util\ tcl`)
° If necessary, modify the environment variable PATH so that it points to the file tclsh.exe too.

Pay attention!!!
To use PMTclShell is necessary to have an Tcl port for OS/2 and so to have the standard shell Tcl **_tclsh.exe_** at your disposal.
° The archive src.zip contains the sources of PMTclShell and can possibly be unzipped in a subdirectory.

To do...
- To make fit the pmtclsh.exe command line syntax to that of tclsh.exe.
- Drag&drop support.
- Cut&Paste improvement
