## Seven levels of computing

To provide the seven levels of computing the System 3000 uses three computing architectures: uniprocessing, tightly coupled multi-processing, and loosely coupled parallel processing. The seven levels of computing are as follows:

*Level 1*--System 3100 models are window-compatible portable computers, including notepad and notebook models. The notepad model supports DOS, and the notebook model supports DOS and OS/2.

*Level 2*--System 3200 models are entry-level desktop computers, offering a broad performance range, yet packaged in a small-footprint cabinet. These models will support DOS, OS/2, SCO UNIX, and UNIX System V Release 4.0.

*Level 3*--In the 3300 level, NCR made available three uniprocessor models; the NCR 3320, 3340, and 3345. Each functions as a fully configurable, high-performance workstation as well as an entry-level, workgroup server. Scalable power is achieved through the use of an Intel 386SX 20 MHz or a 486 25 MHz or 33 MHz processor, providing from 7.5 to 27 MIPS. Memory options range from 2 to 64 MB with internal disk storage of up to 680 MB. A 4-slot, 20 MB MCA I/O bus is standard and supports up to 32 direct connections or 64 local area network (LAN)-based connections. These desktop systems offer broad configurability and a wide range of performance, while still maintaining a footprint suitable for office environments. These models support DOS, OS/2, SCO UNIX, and UNIX System V Release 4.0.

*Level 4*--In the 3400 level, NCR is actively marketing the 3445, a uniprocessor server based on an Intel 486 33 MHz microprocessor that provides 27 MIPS of computer power. It uses tightly coupled microprocessor architecture. This model features memory options of 4 MB to 64 MB, SCSI up to 5.0 MB per second, and internal disk storage options of up to 3.3 GB. A processor/memory/bus, with a bandwidth of 176 MB per second and a 7-slot, 20 MB per second MCA I/O bus are included. The NCR 3445 can support up to 128 connections in any combination of direct or LAN attachments. The NCR 3445 supports DOS, OS/2, SCO UNIX, and UNIX System V Release 4.0.

The NCR 3450 is an entry-level, multiprocessor (1-4 asymmetrical

---

multiprocessor) server which operates under the NCR UNIX V.4 multiprocessing operating system. Scalable performance results from the use of 1-4 Intel 486 50 MHz microprocessors providing from 40 to 160 MIPS. The model offers memory options of 4 MB to 256 MB, SCSI up to 10 MB per second, internal and external disk storage options of up to 6 GB and 50 GB respectively, including an arrayed disk option. An 8-slot 80 MB per second MCA I/O bus and dual 32-bit processor/memory busses, with a combined bandwidth of 200 MB per second, support up to 256 connections in any combination of direct or LAN attachments. The multiprocessor model supports UNIX System V Release 4.0 and DOS applications under VP/ix. The availability for the 3445 is immediate and the 3450 is 45-60 days.

*Level 5*--The level 3500, model 3550, is a symmetric, multiprocessor, mainframe-class computer system. The 3550 uses the new NCR UNIX V.4 multiprocessing operating system. Incremental performance results from the use of 2 to 8 Intel 486 50 MHz microprocessors, providing 80-320 MIPS. Memory options range from 16 MB to 256 MB, with internal disk storage up to 13 GB and external disk array capacities of up to 50 GB. Two 8-slot, 80 MB MVA busses provide an aggregate throughput of 160 MB per second and dual 64-bit processor/memory busses result in a combined bandwidth of up to 400 MB per second. Mainframe-class reliability, data integrity, configurability, and performance through scalable, symmetric, tightly coupled multiprocessors. These models support UNIX System V Release 4.0 and DOS applications under VP/ix. The 3550, the only member of this level available, has a 6-8 week availability.

*Level 6*--System 3600 model is NCR's new successors to expensive mainframe clusters. Using loosely coupled parallel processing, these models are the first fruits of the NCR's joint development with, and investment in, Teradata. These models support UNIX System V Release 4.0 and DOS applications under VP/ix. The NCR System 3000/3600 is available for orders. According to International Data Corporation (IDC), the 3600 is considered NCR's UNIX database engine. It incorporates technology from NCR, Teradata, and Sybase. This system is not a conventional mainframe, and NCR is not positioning it as such. While NCR will achieve up to 8-way SMP performance on off-the-shelf software, its parallel performance shines best when running Teradata's SQL engine. Disadvantages: NCR faces a shortage of development

---

tools and lacks experience selling million-dollar systems to MIS. (NCR will target traditional retail and banking customers early on.) IDC does not expect significant revenues or competitive impact until second half 1992.

*Level 7*--System 3700 models offer enormous total performance. Configured with up to thousands of processors, these models are targeted to support the most demanding enterprise applications. Using loosely coupled parallel processing, these models are optimized for online transaction processing and decision support. These models will support UNIX System V Release 4.0 and DOS applications under VP/ix.

## NCR System 3000 Comparison

### Migration plans to the NCR 3000 platform

According to users and industry executives, AT&T/NCR's merged product line will give the new company a strong technology offering in distributed computing with solid connectivity and network management products, and a head start in the emerging technology of cooperative computing (see migration chart).

The networking architecture for the combined operation will be NCR's standard-based Open Cooperative Computing Architecture (OCCA see appendix for details), which has superb SNA connectivity, filled out with AT&T's Stargroup LAN Manager for connections to desktop PCs and Apple Macintoshes. The new company's network management strategy will use AT&T's system manager and computer manager which has UNIX system connectivity. Regarding cooperative computing, the combined organization is relying on cooperation from NCR.

NCRAPX02.HPG;4.565";3.356";HPGL

The story on the hardware side is largely one Intel architecture line being replaced by another, as AT&T products get phased out and replaced by NCR's new System 3000 line.

NCRAPX03.HPG;4.565";3.356";HPGL

The two major products that are being eliminated entirely are the Motorola-based NCR Tower line and AT&T 3B2 with its proprietary Western Electric processor.

NCRAPX04.HPG;4.565";3.356";HPGL

AT&T recently released a MIPS RISC-based 3B2 (3B2/1000 R3). And will now OEM Pyramid's MIPS RISC-based Mlserver S Series. AT&T calls it the System 7000/R3. The 3B2 is expected to be supported by AT&T through 1993. The System 7000 Series, which AT&T currently OEMs from Pyramid Technology, is expected to begin migrating to the Model 3500 by the end of 1992. The combined organization will continue support for the StarServer FT, a fault-tolerant machine OEM'ed from Tandem.

---

Overall, users of AT&T products will continue to be supported as long as they wish to stay with the AT&T line. The plan is to eventually phase out the AT&T product line.

## NCR V Series System Comparison

9800 VRX/E  
System  
Models 9811, 12, 21, 32,  
42, 44, 63, 66, 84, 88  
System Characteristics:  
No. of CPUs  
1-8 (AP\*)  
No. of I/O Processors  
1-8 (DSP\*\*)  
Plug Compatible with  
NA  
Main Storage:  
Type  
64 K-bit MOS  
Cycle Time, nanoseconds  
100  
Access Time, nanoseconds  
330  
Minimum Capacity, bytes  
4 M per AP, 4 M per DSP  
Maximum Capacity, bytes  
16 M per AP, 16 M per DSP  
Increment Size, bytes  
4 M  
Expanded Storage  
NA  
Cache Storage:  
Type  
NA  
Cycle Time, nanoseconds  
NA  
Minimum Capacity, bytes  
1 M or 3 M (DSP)  
Maximum Capacity, bytes  
1 M or 3 M (DSP)  
Increment, bytes  
NA  
Central Processor:  
Relative Performance, MIPS  
1 to 8  
Machine Cycle Time, nanoseconds  
100 (AP)  
Word Length, bits  
32
