Tips 'n' Tricks
Graham Townley-Rivett, Myponga, AUSTRALIA

I guess if I suggested we have a "tips 'n' tricks" section then I had better make a contribution, here are a few:

1.   You can substitute a <space> for a wildcard character (*). e.g., instead of typing: copy a:*.* you would type: copy a:<space>.<space>

2.   If you have a need to modify your PATH for any reason, yet require it set back to the original at a later stage, there is a very simple way to record the current PATH. If you type the following line, it will create a batch file containing the current PATH settings. Path >OLDPATH.BAT. You can now issue a new PATH command and when you want to restore the original, just invoke the OLDPATH.BAT file.
