To install VCalc V2.7 on your computer:
(For help with these steps, see the Windows manual and/or DOS manual)

1) Create a new directory for VCalc.

2) Copy all of VCalc's files into the new directory just created. The files required are:
>   **COMMDLG.DLL**
>   **GSWDLL.DLL**
>   **MSAFINX.DLL**
>   **GSW.EXE**
>   **VCALC27.EXE**
>   **VCALCG27.EXE**
>   **VCALC27.HLP**
>   **CMDIALOG.VBX**
>   **GRAPH.VBX**
>   **THREED.VBX**
>   **TRUEGRID.VBX**
>   **INSTALLV.WRI**
>   **FILE_ID.DIZ**

3) Add "VCALC27.EXE" as a new program item

4) Make sure that the file, "VBRUN300.DLL" exists on your computer. It should be located in either the "WINDOWS/SYSTEM" directory, or else in the same directory as VCalc. If it can't be found, then can be download it from most any on-line service.

5) That should do it!

If upgrading from a previous 2.X version of VCalc: Copy all of the V2.7 files into your existing VCalc directory, overwriting the older ones. This will not affect the data files, and the password will remain the same.
