Help topics for WinZip are listed below. Use the scroll bar to see entries not currently visible in the Help window.

To learn to use Help press the F1 key or choose **Using Help** from the Help menu.

To read the help information sequentially, use the buttons labeled >> and << on the Help toolbar.

For information specific to the Win32 version see the section titled [WinZip for Windows/NT](#).

Quick Start Information

Many people who have used both ZIP files and other Windows applications will be able to use WinZip without reading all the documentation. Here are pointers to portions of the documentation that can help you get started quickly:

- The section titled [WinZip Installation](#) contains brief installation instructions.
- The section titled [Brief Tutorial](#) shows you how to work with existing ZIP files and how to create new ones.
- The section titled [Drag and Drop Interface](#) describes a useful WinZip feature. Be sure to give it a try!
- The section titled [Hints and Tips](#) describes a number of techniques you will probably find useful.

Press the F1 key at any time while running WinZip to access complete context sensitive help. To learn how to use the online help system choose **How to Use Help** from WinZip's Help menu.

Overview

WinZip brings the convenience of Windows to the use of ZIP files. TAR, gzip, Unix compress, Microsoft Compress, LZH, ARJ, and ARC files are also supported. WinZip features an intuitive point and click interface for viewing, running, extracting, adding, deleting, and testing files in archives. Optional virus scanning support is included.

Here's what the magazine reviews say about WinZip:

- "For the price and all the services it provides, anyone using .ZIPped files today cannot go wrong with this program", Windows Sources 7/94
- "Must Buy" rating, PC Laptop, 7/94
- "Slick and Intuitive", Computer Shopper, 5/94
- "Easy to use", InfoWorld, 4/18/94
- "It's this simple: Those who use PKZIP and Windows should get a copy of WinZip 5.0", PC Computing, 12/93
- One of the "Top 10" Windows Utilities, CompuServe Magazine, 10/93
- One of the "20 Must-Have Windows Utilities", Windows User, 6/93
- "Archive Manager Extraordinaire", Windows Sources, 5/93
- "WinZip 4.0 improves on an already impressive product, making archiving a simple task for Windows users", Windows User, 5/93
- WIN100 Award Winner, Windows Magazine, 2/93
- "Repeatedly charms you when you have to ZIP and unZIP ... an excellent Shareware utility", Windows Magazine, 12/92
- "Our copy gets quite a daily workout", Windows User, 11/92
- "The most comprehensive Windows front-end to PKZIP", Ziffnet Threads, 11/92
- "Does all your compression chores with ease", Computer Shopper, 10/92
- "Must-Have Shareware Treasure", Compute, 10/92
- "The perfect Windows interface for LHA, PKZIP, ARC, and your favorite DOS virus scanner", PC World, 10/92
- "Greatly facilitates archive management", Windows Magazine, 9/92
- "Powerful yet Intuitive", PC World, 8/92
- "Hot Product", Inside Microsoft Windows, 8/92
- "WinApp of the Month", PC Computing, 3/92

WinZip is extremely easy to use! To open an archive simply double click on an archive listed in the File Manager, drag and drop an archive onto WinZip, or use the standard Open dialog box. The main WinZip window features a list box with the names, sizes, and date/time stamps of all files in the open archive. This list can be scrolled and sorted on any field. A tool bar provides fast access to commonly used actions. All options (including window size and position) can be saved and restored. Extensive context sensitive help is always available.

Double clicking on a file in the main WinZip window has the same effect as double clicking in the File Manager. First the file is extracted from the archive. If the file is executable, it is run. Otherwise, the file is opened by the appropriate application (for example, Windows Write for *.WRI files) based on standard Windows associations.

The Windows Drag and Drop interface is fully supported. You can drag and drop files from WinZip to other applications. WinZip will extract the files before dropping them on the target application. The target application will treat the files as if they had been dropped by the File Manager. You can also drop

archives on WinZip to open them, or drop files on WinZip to add them to the open archive.

WinZip's unique Install/Uninstall Feature makes it easy to install *and uninstall* software distributed in archives. This feature can save megabytes of disk space by tracking and removing all traces of an application. WinZip will run the installation program in an archive, give you a chance to try the program, and optionally offer to restore your system to its original state. The uninstall step can selectively remove directories, files, icons, or program groups created by an install program, and can restore any altered INI files. You have complete control over the uninstall process, and no changes are made without approval.

If an archive doesn't have an "install" or "setup" program you can use the CheckOut facility to easily try the files in the archive. The CheckOut facility will extract all files and create a program group with icons for all or some files. Just double click on an icon in the CheckOut group to view the corresponding file with the appropriate application. WinZip will optionally delete the CheckOut files and program group.

WinZip requires Windows 3.1 or later. No other programs are required to add or extract files from ZIP files, or to work with TAR, gzip, and Microsoft Compress format files. However, virus scanning and operations involving ARC, ARJ, and LZH files as well as some advanced ZIP operations require external programs. PKZIP and PKUNZIP are only needed if you create ZIPs that span disks, create a self-extracting EXE file, or use password protected ZIP files. To access LZH files you need the LHA.EXE from Haruyasu Yoshizaki. Similarly, to access ARJ files the Shareware ARJ product from Robert Jung is required. WinZip interfaces to several programs to access ARC files and optionally runs most virus scanning utilities. For details see the section titled System Requirements.

WinZip is distributed as Shareware. This means that users are encouraged, subject to restrictions described in the License Agreement, to share copies of the **evaluation version** of WinZip with friends, associates and bulletin boards. Please remember that if you use WinZip you are required to pay the registration fee of \$29 as described in the section titled Copyright/License Agreement/Warranty.

This program is produced by a member of the Association of Shareware Professionals (ASP). ASP wants to make sure that the shareware principle works for you. If you are unable to resolve a shareware-related problem with an ASP member by contacting the member directly, ASP may be able to help. The ASP Ombudsman can help you resolve a dispute or problem with an ASP member, but does not provide technical support for members' products. Please write to the ASP Ombudsman at 545 Grover Road, Muskegon, MI 49442 or send a CompuServe message to the ASP Ombudsman at 70007,3536.

About ZIPs And Other Archives

Archives are files that contain other files. Typically the files in an archive are compressed. Archives usually have file names ending with ZIP, LZH, ARJ, or ARC, depending on how they were created. Archives make it easy to group files and make transporting and copying these files faster.

Typical uses:

- Most files available in "file areas" on bulletin boards and electronic services like CompuServe and the Internet are distributed as archives. Two benefits of using archives for electronic file distribution are that only one file transfer operation ("download") is required to obtain all related files, and file transfer time is minimized because the files in an archive are compressed. See the sections titled [Install/Uninstall Feature](#) and [CheckOut Feature](#) for information on WinZip features particularly suited for working with downloaded files.
- It is often useful to send a group of related files to an associate. Rather than distributing individual files it is often easier to distribute the files as an archive to benefit from the file grouping and compression.
- Some files are important but not used often. To save disk space simply compress these files into an archive when they are not used, and decompress them only when needed.

Archive formats:

- ZIP files are the most common archive format. WinZip does **not** require external programs for basic archive operations (PKZIP and PKUNZIP from PKWARE, Inc. are, however, required for two advanced options: disk spanning and encryption).
- ARJ files are another popular archive format. ARJ files are manipulated by the ARJ program from Robert Jung, 2606 Village Road West, Norwood, Massachusetts 02062.
- LZH files are manipulated by the LHA program from Haruyasu Yoshizaki. LHA won the October 1991 PC Magazine Editor's Choice award as the best data compression utility.
- ARC is an older format. ARC files can be manipulated by several programs, including the original ARC, ARCE (also known as ARC-E), PKXARC, and PKUNPAK. Since almost all new archives are created in other formats and there is no single widely available program to manipulate ARC files, WinZip does not provide facilities to add to ARC files (however, all other WinZip functions are supported).
- TAR, Z, GZ, TAZ, and TGZ files are often found on Unix-based Internet sites. The relationship between these file types is less straight forward than the aforementioned file formats. The important thing to remember is that WinZip handles all these formats the same way as ZIP files, so you don't need to know the details. Here are is more information on these formats: TAR stands for "Tape ARchive". This is an old file format and does not provide compression; it is used only to group files. Z files are compressed with the gzip or the older Unix "compress" program. GZ files are gzip files. Z and GZ files cannot contain multiple files. TAZ and TGZ files are TAR files compressed in "Z" or "GZ" format. Since almost all new archives are created in ZIP format WinZip does not provide facilities to add to or create files in these formats (however, all other WinZip functions are supported). WinZip does not require external programs when working with files in these formats.
- Microsoft Compress format files (also known as LZEXPAND files) usually end with a trailing underscore, for example, "commdlg.dl_". Like Z and GZ files, Microsoft Compress format files contain only one file. This format is used for many files on your Windows 3.x distribution disks and many other Microsoft products. Note that not all files ending with an underscore are Microsoft Compress format files.

See the section titled [System Requirements](#) for more information on version numbers and availability of the external programs supported by WinZip.

Brief Tutorial

This section provides a brief tutorial on basic WinZip operations. To print the tutorial, click on **Print Topic** in the Help window's File pull-down menu. The tutorial assumes the following:

- Your system meets the requirements described in the section titled [System Requirements](#) and you have installed WinZip as described in the section titled [WinZip Installation](#).
- You know how to use standard Windows features, such as dialog boxes, menus, and the drag and drop interface. If you are not familiar with these features, please consult your Windows documentation.
- You are familiar with the concept of archives. For a description of archives, see the section titled [About ZIPs And Other Archives](#).

Remember that context sensitive help is always available. Press the F1 key at any time to access the full documentation.

If you are new to the Windows online help system be sure to choose **How to Use Help** from WinZip's Help menu. The time you spend on that will pay off quickly!

Before starting, select **Set Installation Defaults** from WinZip's Options pull-down menu to ensure the following examples will work.

Terminology

As described earlier, archives are files that contain other files. ZIP files are the most common archive format. Typically the files in an archive are compressed. WinZip uses the term "Add" to mean "compress files and add them to an archive". Extract means "decompress files in an archive, creating separate files on a disk". Some people use the verbs "zip" and "pack" instead of Add, and "unzip" or "unpack" instead of "extract".

Step by Step Example

This brief tutorial provides introductory information, but requires that you specify the relevant filenames, directory names, etc. If you are not sure what names to specify, or would like an easy "click by click" example, you will probably prefer to read the section titled [Step by Step Example](#) before continuing with this section.

Working with Existing Archives

The first step is to open an archive. Select **Open Archive** from the WinZip File pull-down menu to activate the standard **Open Archive** dialog box. Then select the archive you want to open in the **Open Archive** dialog box. Opening an archive is just like opening a document in Write or a spreadsheet in Excel; the only difference is that you open an archive instead of a document or spreadsheet. Use the **Drives** and **Directories** list boxes to select the appropriate directory and click on the archive in the **Archive Name** list box. Press the **OK** button when you have made your selection.

Once an existing archive is open you can work with the files in the archive. The files in an archive are listed in a list box in the main WinZip window. You can

- View a file with the [associated](#) program by double clicking on the file in the main WinZip window, or view a file with the built-in text viewer or a viewer of your choice by selecting **View** from the Actions pull-down menu.
- Extract the files from an archive to a directory on your hard disk by selecting **Extract** from the Actions pull-down menu.
- Install or try out software distributed in the archive. See the sections titled [Install/Uninstall Feature](#) and [CheckOut Feature](#) for two WinZip features that are particularly useful for working with archives on CD-ROMs and archives downloaded from bulletin boards, the Internet, or information services like CompuServe.
- Add files to the archive as described later in the tutorial in the section titled [Adding Files to an Archive](#).

- Scroll the list of files in the archive using the scroll bar, or sort the list by file name, file date, or file size using one of the **Sort** entries in the Options pull-down menu.

If you download archives you may be interested in the section titled [Suggestions For Working With Downloaded Files](#).

For complete documentation on available actions click on the appropriate entry in the Commands and Procedures section in the Table of Contents.

Creating New Archives

To create a new archive, select **New Archive** from the WinZip File pull-down menu. This activates the **New Archive** dialog box. Type the name of the archive you want to create. *Do not enter the name of the files you want to compress.* This dialog box works almost like the standard Windows **Open** dialog box. You can use the **Drives** and **Directories** list boxes to choose the drive and directory where the archive will be created. For example, to create an archive on your floppy drive select **A:** from the **Drives** drop-down list box. The names of any existing archives on the selected drive and directory will be listed in gray to help you choose a name that is not already in use.

Normally after creating an archive you will want to add files to the archive, so verify that the **Add Dialog** check box is checked to automatically activate the **Add** dialog box. Press the **OK** button to complete your selection. See the next section for instructions on adding files to an archive.

Adding Files to an Archive

You can add files to an existing archive you've opened (as described above in the section **Working with Existing Archives**) or to a new archive you've created (as described above in the section **Creating New Archives**). If the **Add** dialog box is not displayed select **Add** from the Actions pull-down menu. **Error! Bookmark not defined.**

In the **Add** dialog box you can select the files to add to the archive in one of two ways:

1. Type the name(s) of the file(s) you want to add to the archive. Multiple names can be separated by spaces, for example, *.TXT *.DOC will add all TXT and DOC files.
2. Click on files listed in the **Select Files** list box on the right side of the **Add** dialog box. You can select multiple files as described in the section [Using Extended Selection List Boxes](#). Use the **Directories/Drives** list boxes to choose the drive and directory of the files listed.

When you are done selecting files, press the **Add** button. Once WinZip finishes adding the files it will update the list of files in the main window to reflect the new files in the archive.

You can also add files to an archive by dragging the files you want to add from the File Manager and dropping them on the WinZip window. This is described in detail in the section titled [Adding a File to an Archive with the Drag and Drop Interface](#).

Note: when you add files to an archive the original files on disk are *not* deleted unless you select **Move** from the **Action** drop-down list. However, since the **Move** action deletes files, practice using test files before using this feature.

Shortcuts:

The WinZip toolbar (below the menu bar) provides shortcuts for many of the menu actions mentioned in the tutorial. The **New** and **Open** buttons perform the same function as clicking on **New** or **Open** in the File pull-down menu. Similarly, the **Add**, **Extract**, and **View** buttons on the toolbar perform the same action as the equivalent menu entries in the Actions menu.

You can quickly sort the main window by clicking once on the header (e.g. click on "Name" in the header above the list of files to sort the list by filename).

It is often easier to open an archive by double clicking on the archive in the File Manager, or by dragging the archive from the File Manager to an open WinZip window. For information on using the File Manager with WinZip see the section titled [File Manager Interface](#).

Configuration:

Many WinZip operation can be tailored using configuration options. For example, you can change the

default directories for the **Extract** and **Add** dialog boxes. Most options are intended for advanced users. For an overview of available options see the section titled [Options](#).

Conclusion:

This concludes the brief tutorial. If you have questions, feel free to contact the author at the address listed in the **About** dialog box.

Step by Step Example

This section provides step by step examples of using WinZip. To print this section, click on **Print Topic** in the Help window's File pull-down menu. Like the Brief Tutorial, this section assumes the following:

- Your system meets the requirements described in the section titled [System Requirements](#) and you have installed WinZip as described in the section titled [WinZip Installation](#).
- You know how to use standard Windows features, such as dialog boxes, menus, and the drag and drop interface. If you are not familiar with these features, please consult your Windows documentation.
- You are familiar with the concept of archives. For a description of archives, see the section titled [About ZIPs And Other Archives](#).

If you follow the steps below you will create a new archive, add two files to the archive, view a file in the archive, and extract the files in the archive to a new directory. This should give you a feel for using WinZip. After following this example you will probably want to (re)read the section titled [Brief Tutorial](#).

Be sure to follow these steps EXACTLY to ensure correct results. Rather than trying out interesting options, just follow along to be sure you and the description below don't get "out of sync".

Unlike the Brief Tutorial, this section uses specific filenames. You can follow along by typing exactly what is shown. However, since the author doesn't know what files exist on your system, you'll have to create a directory and two test files with specific filenames before starting to work with "live" ZIP file. The following four steps detail this procedure. These steps involve using standard Windows features. For conceptual information and details on the use of these four steps please consult your Windows documentation. Meanwhile, be sure to follow these instructions exactly.

- 1 Create the C:\FOO directory. If you already have a directory called C:\FOO you will have to substitute a different directory name in the following examples. Create the directory as follows: start the File Manager by double clicking on the File Manager icon in the Program Manager's "Main" group. Select **Create Directory** from the File Manager's File pull-down menu. Type the following:

```
c:\foo
```

Be sure to type a backwards slash as shown, not a normal forward slash! Then press the **OK** button. Finally close the File Manager (select **Exit** from the File Manager's File pull-down menu).

- 2 Create the file C:\FOO\ONE.TXT as follows: start Notepad by double clicking on the Notepad icon in the Program Manager's "Accessories" group. Type the following text into Notepad's main window:

```
this is the first file
```

Next save the file to disk by selecting **Save As** from Notepad's File pull-down menu. Type the following filename:

```
c:\foo\one.txt
```

Then press the **OK** button.

- 3 Create the file C:\FOO\TWO.TXT as follows: Replace the next in Notepad's main window with the following text:

this is the second file

Next save the file to disk by selecting **Save As** from Notepad's File pull-menu. Type the following filename:

c:\foo\two.txt

Then press the **OK** button.

- 4 Close Notepad (select **Exit** from Notepad's File pull-down menu)

Now we will create an archive containing the two files you created in the previous step. Please be sure to follow these instructions exactly:

- 1 Start WinZip by double clicking on the WinZip icon in the Program Manager's WinZip group. Select **Set Installation Defaults** from WinZip's Options pull-down menu and reply **Yes** when asked if you want to reset the installation defaults.
- 2 Select **New Archive** from WinZip's File pull-down menu. At this point you should see a dialog box titled **New Archive**. This dialog box is where you specify the name of the archive you are going to create. All the normal Windows techniques for changing the current directory and selecting filenames will work, but for now, just type the following filename for your new archive

c:\foo\test.zip

Verify that the **Add Dialog** check box is checked. Then press the **OK** button.

- 3 At this point you should see a dialog box titled **Add**. This dialog box is where you specify the names of the files you want to put into the archive. You can read detailed information about all the fields in the **Add** dialog box by pressing the **Help** button, but please don't do that now! Instead, follow these instructions exactly to be sure to stay in sync with the tutorial. As in the **New Archive** dialog box, all the normal Windows techniques for changing the current directory and selecting filenames will work, however, just type the following two filenames, separated by a space:

one.txt two.txt

Verify that the **Action** drop-down listbox specifies **Add**, and press the **Add** button on the top right of the dialog box. WinZip will add the two files to the archive TEST.ZIP created in the previous step.

- 4 When the Add operation completes, you should see the main WinZip window, titled "WinZip - C:TEST.ZIP", showing the two files you just added in the main listbox below the toolbar.

At this point you have successfully added two files to an archive. The files ONE.TXT and TWO.TXT exist in two places: in the c:\foo directory where you originally created them, and in the archive c:\foo\test.zip.

Next we will view one of the two files in the archive.

- 1 In WinZip's main window double click on the line that starts with TWO.TXT. WinZip will automatically start the appropriate program to view the file TWO.TXT. In most cases this will be Notepad.
- 2 At this point Notepad (or another viewer) should be running. The active window should be titled something like "Notepad - ONE.TXT". The main window will show the text you typed at the beginning of this example.
- 3 When you are done viewing the file, select **Exit** from the viewer's File pull-down menu to return to the main WinZip window.

Finally, we will extract the files to a new directory. While this operation is redundant in this example (because you already have the files in the C:\FOO directory) it is a useful technique when you receive archives created elsewhere, for example, from an associate or an online service.

In this example we'll extract the files in TEST.ZIP to the C:\BAR directory. If you already have a directory called C:\BAR you will have to substitute a different directory name in the following examples.

- 1 Select **Extract** from WinZip's Actions pull-down menu. At this point you should see a dialog box titled **Extract**.
- 2 In the **Extract To** field type the following

c:\bar

Click the **All Files** radio button to tell WinZip to extract all files in the archive to the c:\bar directory.

- 3 Press the **Extract** button on the top right of the dialog box. The directory C:\BAR will be created, and both files in the archive will be extracted from TEST.ZIP to the C:\BAR directory.
- 4 When the extract operation completes, the main WinZip window will once again be active. Select **Exit** from WinZip's File pull-down to close WinZip and conclude this example.

At this point you have created an archive, added two files to the archive, viewed a file in the archive, and extracted the files in the archive to a new directory. The files ONE.TXT and TWO.TXT exist in three places:

In the directory c:\foo, where you originally created them

In the archive c:\foo\test.zip, because you added them to the archive

In the directory c:\bar, because you extracted them.

You may want to delete the c:\foo and c:\bar directories using the File Manager, since you no longer need these directories or the files they contain.

Important: there are many faster ways to work with WinZip and archives! These examples were complicated by an attempt to use known filenames and dependencies on the directories already on your hard disk. In particular, be aware of the following:

- 1 Rather than typing fully qualified filenames like c:\foo\one.txt you can almost always avoid typing the drive and directory by clicking in the **Directory** list boxes in the New Archive, Add, and Extract dialog boxes.
- 2 You can avoid typing existing filenames in the Add dialog box by clicking on the filenames in the Files listbox. For information on selecting multiple files at once see the section titled [Using Extended Selection List Boxes](#).
- 3 You can go even further by using drag and drop. See the section titled [Drag and Drop Interface](#) for more information on this very useful feature.

Don't forget: press the F1 key or the Help button in any WinZip dialog box to get context sensitive help.

Installing Optional External Programs

WinZip includes built-in ZIP and UNZIP, so no other programs are required for most WinZip operations. However, virus scanning and operations involving ARC, ARJ, and LZH files as well as some advanced ZIP operations require external programs. These optional external programs are not distributed with WinZip. You must tell WinZip where to find these programs as described in the section titled [Program Locations](#). This section provides a step by step example of how to install LHA, one of the supported external programs. The same techniques can be used to install the other external programs distributed on bulletin boards.

Remember: the use of these external programs are optional. If you are just getting started with WinZip you will probably want to skip this section and work without the external programs until you encounter a need for the external programs and are more familiar with WinZip.

These instructions assume you are comfortable working with the Windows File Manager, know how to use standard Windows features such as dialog boxes and menus, and have a little experience using WinZip. See the section titled [Brief Tutorial](#) for introductory information.

The first step in installing an external program is to acquire the external programs. See the section titled [System Requirements](#) for information on obtaining these programs.

This example installs LHA. LHA is distributed as a self-extracting archive called LHA213.EXE. Once you've downloaded LHA213.EXE, follow these steps:

1. Use the File Manager to create the directory C:\LHA. You can use a different directory but then you will need to substitute that directory name in the following instructions.
2. Use the File Manager to copy LHA213.EXE from your download directory to the C:\LHA directory.
3. Double click on LHA213.EXE to run it. This will cause the files in LHA213.EXE to "self-extract" into the C:\LHA directory. Then back-up and delete C:\LHA\LHA213.EXE, as it is not needed for day-to-day work with LHA and WinZip.
4. Start WinZip. Pull down the Options menu and select **Program Locations**.
5. In the LHA field in the **Program Locations** dialog box type

c:\lha\lha.exe

and press the **OK** button.

That's all there is to installing LHA. You can now access .LZH files (created by LHA) the same way you access ZIP files. Use similar procedures for ARJ, ARC, and PKZIP. Be sure to read the section [Virus Scanner Configuration](#) before installing a virus scanner.

Suggestions For Working With Downloaded Files

WinZip makes it easy to work with files downloaded from Internet, bulletin boards, and online services like CompuServe. The [Install/Uninstall Feature](#) and [CheckOut Feature](#) are particularly useful for trying files that are downloaded. The [Archive Management](#) features make it easy to move archives to floppies, or even to delete them if they don't meet your needs.

To print this page, click on **Print Topic** in the Help window's File pull-down menu.

This description assumes you have read the [Brief Tutorial](#).

One strategy for handling downloaded files involves three directories:

| | |
|-----------|-----------------------------------|
| \DOWNLOAD | recently downloaded files |
| \UPLOAD | files you are planning to upload |
| \ARCHIVES | archives you are planning to keep |

A relatively empty download directory makes it much easier to stay organized. It is a good idea to download all archives into your \DOWNLOAD directory, and after each on-line session perform the following steps for each archive:

1. Open the archive. An easy way to open files is to first activate the File Manager and view the \DOWNLOAD directory. Then double click on an archive to open it. You will probably want to select **Sort By Date** from the File Manager's **View** pull-down menu so that the most recent files are shown at the top of the list.
2. Read about the software in the archive. Many archives contain a file named "file_id.diz". By convention this file contains a brief description of the archive contents. If this file is listed in the main WinZip window double click on it to view its contents. When you are done viewing the file close the program being used to view the file. Repeat this process for any files with the word "read" in the filename (e.g. "readme.txt" or "read.me").
3. Try the software if the archive looks interesting. Press the right-most button on WinZip's toolbar to try the software in the archive. Depending on whether the archive contains an "install" or "setup" program the right-most toolbar button will activate either the [Install/Uninstall Feature](#) or the [CheckOut Feature](#). For details see the corresponding section of the documentation (remember: you can press F1 at any time while running WinZip for online help).
4. Move each archive out of your download directory after trying the software. If you want to keep the archive on your hard disk select **Move** from the File menu to move the archive into your \ARCHIVES directory, or, if you want to post the archive on another BBS, move it into your \UPLOAD directory. Note that the directories you have most recently used for move and copy operations are available for quick access in a drop-down list. If you don't want to keep the file you downloaded you can easily move it to a floppy or delete it using the **Delete** entry in the File pull-down menu.

Of course there are other good ways to use WinZip to work with downloaded files. Feel free to modify the aforementioned procedure or ignore it entirely.

Copyright/License/Warranty

WinZip® Copyright © 1991-1995 by Nico Mak Computing, Inc.
All rights reserved.

License Agreement

You should carefully read the following terms and conditions before using this software. Unless you have a different license agreement signed by Nico Mak Computing, Inc. your use of this software indicates your acceptance of this license agreement and warranty.

Shareware Version

Evaluation and Registration

This is not free software. You are hereby licensed to use this software for evaluation purposes without charge for a period of 21 days. If you use this software after the 21 day evaluation period a registration fee of \$29 is required. Payments must be in US dollars drawn on a US bank, and should be sent to Nico Mak Computing, Inc., P.O. Box 919, Bristol, CT 06011- 0919. Credit card ordering and quantity discounts are available, as described in the section Ordering Information/Order Form. When payment is received you will be sent a registered copy of the latest version of WinZip.

Unregistered use of WinZip after the 21-day evaluation period is in violation of U.S. and international copyright laws.

Distribution

Provided that you verify that you are distributing the Shareware Version (select About from the WinZip Help menu to check) you are hereby licensed to make as many copies of the Shareware version of this software and documentation as you wish; give exact copies of the original Shareware version to anyone; and distribute the Shareware version of the software and documentation in its unmodified form via electronic means. There is no charge for any of the above.

You are specifically prohibited from charging, or requesting donations, for any such copies, however made; and from distributing the software and/or documentation with other products (commercial or otherwise) without prior written permission, with one exception: Disk Vendors approved by the Association of Shareware Professionals are permitted to redistribute WinZip, subject to the conditions in this license, without specific written permission.

Registered Version

One registered copy of WinZip may either be used by a single person who uses the software personally on one or more computers, or installed on a single workstation used nonsimultaneously by multiple people, but not both.

You may access the registered version of WinZip through a network, provided that you have obtained individual licenses for the software covering all workstations that will access the software through the network. For instance, if 8 different workstations will access WinZip on the network, each workstation must have its own WinZip license, regardless of whether they use WinZip at different times or concurrently.

Governing Law

This agreement shall be governed by the laws of the State of Connecticut.

Disclaimer of Warranty

THIS SOFTWARE AND THE ACCOMPANYING FILES ARE SOLD "AS IS" AND WITHOUT WARRANTIES AS TO PERFORMANCE OF MERCHANTABILITY OR ANY OTHER WARRANTIES WHETHER EXPRESSED OR IMPLIED. In particular, there is no warranty for the optional virus scanning feature (WinZip does not scan for viruses, it simply runs external programs that claim to perform this function). Because of the various hardware and software environments into which WinZip may be put,

NO WARRANTY OF FITNESS FOR A PARTICULAR PURPOSE IS OFFERED.

Good data processing procedure dictates that any program be thoroughly tested with non-critical data before relying on it. The user must assume the entire risk of using the program. ANY LIABILITY OF THE SELLER WILL BE LIMITED EXCLUSIVELY TO PRODUCT REPLACEMENT OR REFUND OF PURCHASE PRICE.

Order Form

WinZip® 5.6

Ordering by check: To order by check send this order form and a check to Nico Mak Computing, Inc., P.O. Box 919, Bristol, CT 06011. To print this order form, click on Print Topic in the File pull-down menu. Alternately, you can print the ASCII text file ORDER.TXT. Payments must be in US dollars drawn on a US bank, or you can send international postal money orders in US dollars.

Credit card ordering: For information on ordering by MasterCard, Visa, American Express, or Discover by phone, FAX, or CompuServe email, or postal mail, click here: [Credit Card Ordering Information](#).

CompuServe Registration: To have the registration fee added to your CompuServe bill type GO SWREG at the ! prompt and follow the menus. WinZip's registration id is 402.

Purchase Orders: For information on using purchase orders click here: [Purchase Orders](#).

Ordering options outside the USA and Canada: For information on local registration click here: [Ordering Options Outside the USA and Canada](#).

Site licenses: a site license for WinZip entitles an organization to receive one copy of the distribution package and duplicate the distribution disk for the specified number of copies.

3.5 inch disks are sent unless a 5.25 inch disk is requested.

Prices include shipping by postal mail (airmail outside USA).

Prices guaranteed through June, 1995.

Credit Card Ordering

To order by MasterCard, Visa, American Express, or Discover, call the Public (software) Library at 1-800-2424-PsL or 713-524-6394 or send your order by FAX to 1-713-524-6398 or by CompuServe Email to 71355,470 or Internet mail to 71355.470@compuserve.com. You can also mail credit card orders to PsL at P.O. Box 35705, Houston, TX 77235-5705.

Please be sure to include your credit card number and expiration date on all credit card orders.

Nico Mak Computing, Inc. cannot be reached at the numbers above.

These numbers are for PsL, a credit card order taking service only.

Any questions about the status of the shipment of an order, refunds, registration options, product details, technical support, volume discounts, dealer pricing, site licenses, etc., must be directed to Nico Mak Computing, Inc., P.O. Box 919, Bristol, CT 06011-0919 or by email to 70056,241 on CompuServe or 70056.241@compuserve.com on Internet.

Purchase Orders

Purchase orders (net 30 days) are accepted only from government and accredited educational institutions and major corporations, provided that they are submitted on purchase order forms with a purchase order number. Please be sure to include the standard WinZip order form with a purchase order. Due to the extra work involved in processing purchase orders you are encouraged to use a credit card, CompuServe's SWREG registration service, petty cash, or an expense account when possible for small orders.

Ordering Options Outside the USA and Canada

In addition to the aforementioned registration options you can contact the following distributors for local registration and support. Dealer prices may vary.

Japanese Users: Contact P&A Co., Ltd., of Japan 302 Bellwinds, 1367-23, Nakagami, Akishima, Tokyo, 196, Japan Phone: 0425-46-9141 / Fax: 0425-46-9142, for local registration.

French Users: Contact AB Soft, Park Burospace #14, 91572 Bievres Cedex, France, phone 33-1-69-33-70-00 for a French version of WinZip.

Other International Users: Contact ASi or an ASi reseller. ASi USA 513-885-2031, fax 513-885-2032. The following ASi resellers have agreed to sell WinZip at (or near) US \$43.50 per copy and will provide local support and registration in local currency.

UK - Atlantic Coast PLC +44(0)1297-552222 fax +44-1297 553366

UK - Targetfour Lmted +44(0)734-772-877, fax +44-734-773-323

[Solutions to two common problems](#)

[How to Report Problems](#)

[Determining Whether A Problem Is Caused By A Faulty Video Driver](#)

Solutions to two common problems

- 1) 99% of all WinZip technical problems are caused by faulty video drivers. This is an easy-to-solve problem. Please see the section titled Determining Whether A Problem Is Caused By A Faulty Video Driver for more information.
- 2) Sometimes archives are corrupted because of line noise while downloading from a bulletin board. If you suspect a corrupted archive, you can test it with the **Test** entry in the Actions pull-down menu. If you are working with a ZIP file, you can try running the PKZIPFIX program distributed with PKZIP to "fix" the archive. Otherwise, if an archive does not pass the "test" operation, you will have to acquire another copy of the file.

How to Report Problems

When reporting problems, please include the following information:

- 1) Is the problem reproducible? If so, how?
- 2) What version of Windows are you running? For example, Windows 3.1, Windows for Workgroups, Windows/NT, etc.
- 3) If a dialog box with an error message was displayed, please include the **full text** of the dialog box, including the text in the title bar.
- 4) If the problem involves an external program like PKZIP.EXE, LHA.EXE, or SCAN.EXE, what version of the failing program are you using? Please see the section titled [System Requirements](#) for minimum version numbers for these programs.

Thank you!

Note: You can press F1 at any time while WinZip is active for context sensitive help.

Determining Whether A Problem Is Caused By A Faulty Video Driver

If WinZip will not run DOS commands (for example, a DOS virus scanner, PKZIP, or ARJ) on your system the most likely cause is a faulty video driver. To determine whether a video driver is causing this problem, install the default Microsoft-supplied VGA driver by following these steps:

- 1) Read all the steps, and do not perform this procedure unless you are comfortable with all of them!
- 2) Double click on SETUP in the Program Manager "Main" group.
- 3) Select Options/Change System settings
- 4) Note the name in the "Display" drop down list box. You will need to remember this name to re-install your existing driver.
- 5) Select VGA from the "Display" drop down list box
- 6) Choose OK to install the driver (you will probably need your Windows distribution disks for this)

After testing WinZip with the VGA driver, you can re-install your video driver by following the steps above, with one change: specify the name of your video driver in step 5 instead of using "VGA".

If the VGA driver solves the problem, try to obtain the most recent driver from your video card vendor. Many video card vendors make their latest drivers available in the GRAPHVEN forum on CompuServe. Alternately, try the Microsoft Driver Library (GO MDL at the CompuServe ! prompt or call Microsoft Product Support at 800-426-9400 (voice) or the Microsoft Download Service BBS at 206-936-6735).

If the above test does not help isolate the problem, or if you are not comfortable installing the VGA driver, contact the author at the address in the About dialog box for a diagnostic aid that may help determine the cause of the problem.

System Requirements

WinZip requires Windows 3.1 or later or Windows for Workgroups.

WinZip for Windows/NT requires a Win32 system compatible with Windows/NT 3.5 or later. It will not run under Windows/NT 3.1.

For information on OS/2 see the section titled Running WinZip under OS/2. WinZip is known to be incompatible with a DOS TSR called "BUFFIT.COM".

No other programs are required to add or extract files from ZIP files. However, some WinZip operations do require other programs. For step by step instructions on installing these programs see the section titled Installing Optional External Programs. The following is a list of these optional programs:

- To create ZIPs that span multiple disks, create self extracting ZIP files, or to access password protected ZIPs, the PKZIP® and PKUNZIP® from PKWARE, Inc. are required. You can download the Shareware version of these programs from most bulletin boards. The latest version is distributed in the self-extracting ZIP file PKZ204G.EXE on bulletin boards and PK204G.EXE on CompuServe. Alternately, you can order them directly from PKWARE (phone 414-345-8699). WinZip has been tested with PKZIP/PKUNZIP 1.1 and 2.0. It will not work with earlier versions.
- To access LZH files the LHA.EXE program from Haruyasu Yoshizaki is required. You can download LHA.EXE from most bulletin boards. The latest version is distributed in the self-extracting LZH file LHA213.EXE. WinZip has been tested with LHA 2.13 and will not work with earlier versions (in particular, it will not function with LHARC, the predecessor to LHA).
- To access ARJ files the ARJ program from Robert Jung is required. You can download the Shareware version of ARJ from most bulletin boards. The latest version is distributed in the self-extracting ARJ file ARJ241.EXE. WinZip has been tested with ARJ 2.30-2.41 and will not work with earlier versions.

To access ARC files one of the following programs is required:

- ARCE.COM and ARC-E.COM version 4.0e - Vern Berg's ARC extraction utility, available on CompuServe and other bulletin boards. WinZip was not tested with earlier versions.
- PKXARC.COM version 3.5 from PKWARE, Inc. WinZip was not tested with earlier versions. This program is still available on some bulletin boards.
- PKXARC.EXE version 3.6 from PKWARE, Inc. This program is still available on some bulletin boards.
- PKUNPAK.EXE version 3.61 from PKWARE, Inc. This program is still available on some bulletin boards.
- ARC.EXE version 5.20 or 6.0 from System Enhancement Associates, Inc. This is the last version of ARC available as Shareware, and is still available on some bulletin boards. WinZip was not tested with earlier versions. SEA's address is 925 Clifton Ave., Clifton, NJ 07013.

WinZip will automatically detect the following virus scanners:

- NAVW and NAV, from Symantec
- WNAPVIR and CPAV, distributed with Central Point Desktop For Windows
- MSAV, distributed as part of MS-DOS 6.0
- SCAN, from McAfee Associates (4423 Cheeney Street, Santa Clara, CA 95054)

WinZip can also be configured to work with most DOS-based virus scanning utilities. For important details, see the section titled Virus Scanner Configuration.

Note: Like WinZip, the PKZIP, PKUNZIP, ZIP2EXE, ARJ, ARC, PKXARC, and SCAN programs are not free software. As with all Shareware, if you use these programs you should register them with the appropriate vendor. The NAVW and WNAPVIR programs are commercial programs, not shareware.

[Running WinZip under OS/2](#)

Running WinZip under OS/2

Due to incompatibilities in the Windows 3.1 emulation of OS/2, some WinZip features do not work in this environment. The built-in zipping and unzipping are fully functional, but operations which involve running external programs are likely to fail. IBM has stated they plan to address these incompatibilities. Enhancements to WinZip to work around this operating system incompatibility are scheduled for the not-too-distant future.

WinZip-Related Files

| Filename | Description |
|-----------------|---|
| README.TXT | introductory information |
| LICENSE.TXT | license agreement/warranty |
| WINZIP.TXT | extracts from online documentation |
| WINZIP.HLP* | documentation in online hypertext help format |
| WINZIP.EXE* | required executable (Windows version only) |
| WZ.DLL* | required dynamic link library (Windows 3.1 only) |
| WZ2.DLL* | required dynamic link library (Windows 3.1 only) |
| WINZIPNT.EXE | required executable (Win32 version only) |
| WZWIN32S.EXE | required executable (Win32 version only) |
| WZ.COM* | required executable |
| WZ.PIF* | required Program Information File |
| ORDER.TXT | order form |
| WHATSNEW.TXT | list of recent changes |
| FILE_ID.DIZ | brief description for bulletin boards |
| VENDOR.TXT | information for Shareware Distributors and Disk Vendors |
| SETUP.EXE | installation program |

* Files marked with an asterisk are distributed with a trailing underscore at the end of the filename. The underscore is replaced with the appropriate character by the SETUP program. For example, WINZIP.HL_ becomes WINZIP.HLP.

WinZip Installation

To install WinZip follow one of these procedures:

- 1) From the Windows Program Manager, choose **Run** from the File menu, type **a:setup**, and press the Enter key.
- 2) Exit Windows, type **win a:setup** at the DOS prompt, and press the Enter key.

The Setup program will issue a number of prompts. Unless you have a reason to override the defaults it is strongly recommended that you press the **OK** or **Yes** buttons to accept the installation default settings.

WinZip Uninstallation

To uninstall WinZip double click on the "Uninstall WinZip" icon in the WinZip program group. If you deleted this icon you can uninstall by choosing **Run** from the Program Manager's File menu, typing **c:\winzip\winzip /uninstall**, and pressing the Enter key (be sure to type the slashes and backslashes exactly as shown, and substitute the appropriate directory name for c:\winzip if WinZip is installed in a different directory).

The "Uninstall WinZip" procedure performs the following steps:

- Verify it is ok to uninstall
- Remove WinZip File Manager Extension from WINFILE.INI if it is installed
- Delete files in WinZip directory if they were installed by this version of WinZip and if the file's date/time stamp matches WINZIP.EXE
- Remove any WinZip file associations from WIN.INI
- Remove [WinZip] entry from WIN.INI
- Remove the WinZip group from the Program Manager
- Remove the WinZip associations from the registration database

Drag and Drop Interface

The Drag and Drop Interface provides a convenient way to:

- 1) Open an archive with WinZip
- 2) Add, freshen, move, and update files in an archive
- 3) Extract files from an archive
- 4) Use an archive in another application

For details click on the appropriate topic below.

Related Topics:

[Opening an Archive with the Drag and Drop Interface](#)

[Adding a File to an Archive with the Drag and Drop Interface](#)

[Extracting Files from an Archive with the Drag and Drop Interface](#)

[Dropping an Archive on Another Application](#)

[Drop Dialog Box](#)

Opening an Archive with the Drag and Drop Interface

To open an archive with the Drag and Drop Interface

- 1) Click on an archive in the Windows File Manager.
- 2) While holding down the mouse button, move (drag) the mouse pointer over a WinZip window. If you've minimized WinZip, you can drag the files to the minimized icon. If you're using the Norton or Central Point Desktops, you can also drag files to inactive WinZip icons.
- 3) Release the mouse button. This opens the selected archive.

Note: you can also open archives by double clicking on the name of an archive in the File Manager, by clicking on the Open button in the main WinZip window, or by selecting Open from the file pull-down menu.

Adding a File to an Archive with the Drag and Drop Interface

To add a file to an archive with the Drag and Drop Interface

- 1) Click on a file in the Windows File Manager.
- 2) While holding down the mouse button, drag (move) the mouse pointer to a WinZip window. If you've minimized WinZip, you can drag the files to the minimized icon. If you're using the Norton or Central Point Desktops, you can also drag files to inactive WinZip icons.
- 3) Release the mouse button to drop the file. This activates the Drop dialog box.

Notes:

To add multiple files to an archive using the Drag and Drop Interface, select the desired files in the File Manager before dragging them to WinZip.

You can also add files to an archive using the Add dialog box.

You cannot use the Drag and Drop Interface to add files with an extension of ZIP, LZH, ARJ, or ARC (use the **Add** dialog box instead).

Extracting Files from an Archive with the Drag and Drop Interface

Before using this portion of the Drag and Drop Interface, please note that it is not documented by Microsoft. Thus, it is not guaranteed to work in future versions of Windows, or even in all Windows 3.1 environments.

You can drag and drop files **from** WinZip **to** other applications. WinZip will extract the files before dropping them on the target application. The target application will treat the files as if they had been dropped by the File Manager.

To extract a file from an archive with the Drag and Drop Interface

- 1) Click on a file in the main WinZip window.
- 2) While holding down the mouse button, drag (move) the mouse pointer to a window that accepts dropped files (the mouse pointer will indicate whether the target window accepts dropped files).
- 3) Release the mouse button to drop the file. This activates the Extract dialog box. Once the files have been extracted from the archive, the target window will process the file you dropped.

Notes:

To extract multiple files from an archive using the Drag and Drop Interface, select the desired files before beginning the drag operation.

You can also extract files by pressing the **Extract** push button or using the **Extract** entry on the Actions pull-down menu.

You can move or copy files from one archive to another by opening multiple copies of WinZip, one for each archive, and dragging files from one to the other.

Important:

Different applications handle dropped files in different ways. For example, when you drop a file on the Write application distributed with Windows it will embed the file as an OLE object, but when you drop a file on the Notepad application it will open the file. You may need to experiment with drag and drop before relying on it.

The Windows File Manager will NOT accept files dropped by other applications. This is not a bug, it is the result of a design decision made by Microsoft.

The Windows Program Manager adds dropped files to the group on which the files are dropped. This provides a very convenient way to add files in an archive to a Program Manager Group. Unfortunately, many people (particularly those who have used OS/2 1.3) would rather drop files on an icon in the Program Manager to start the program associated with the icon, passing the dropped file as a parameter. However, there is nothing WinZip can do about this. Again, this is not a bug, it is the result of a design decision made by Microsoft.

Dropping an Archive on Another Application

You can use the drag and drop interface to drop the open archive on another application as follows:

- 1) Click on the WinZip status line.
- 2) While holding down the mouse button, drag (move) the mouse pointer to a window that accepts dropped files (the mouse pointer will indicate whether the target window accepts dropped files).
- 3) Release the mouse button to drop the open archive.

Examples of when this is useful include:

- Attaching an archive to a mail message when using a mail program like Microsoft Mail.
- Adding an archive to a disk image when using WinImage, a shareware disk image utility available on CompuServe and many BBSs.

Note: if no archive is open you cannot drag and drop from the WinZip status line.

Drop Dialog Box

The Drop dialog box is displayed when you use the Drag and Drop Interface to add files to an archive.

The Drop dialog box lets you change the name of the open archive in one of two ways:

- 1) Type the name of the archive in the **Add to Archive** edit field.
- 2) Click on the **New...** or **Open...** buttons to activate the standard New and Open dialog boxes, respectively.

These shortcuts provide a quick way to add files to a different archive without going through the File pull-down menu.

See the section titled [Adding Files to an Archive](#) for a description of the options available in this dialog box.

Install/Uninstall Feature

WinZip's unique Install/Uninstall feature makes it easy to install *and uninstall* software distributed in archives. This feature can save megabytes of disk space by tracking and removing all traces of an application. WinZip will run the installation program in an archive, give you a chance to try the program, and optionally offer to restore your system to its original state. The uninstall step can selectively remove files, icons, or program groups created by an install program, and can restore any altered INI files. You have complete control over the uninstall process, and no changes are made without approval.

Note: the Install feature is only available if an archive contains an "install" or "setup" program. If the **Install** button is not displayed use the [CheckOut Feature](#) to try the software in the archive.

To use the Install/Uninstall feature

- Press the **Install** toolbar button or select **Install** from the Actions menu to extract all files to a temporary directory and run the install program.
- Try the program that was installed.
- Decide whether to leave the program installed or to uninstall.

If you choose to uninstall WinZip will display the **Uninstall** dialog box which will let you select whether to

- Delete any Groups and Icons created by the installation process.
- Delete any Directories or files created by the installation process.
- Restore your autoexec.bat, config.sys, reg.dat, or ini files if they were changed by the installation process.

Restrictions:

- All configuration changes made between an install and uninstall are considered to have been made by the install process. For example, if you switch to your word processor and save a document *during* the installation process, the document is considered to have been created as *part of* the install process. If you subsequently uninstall, WinZip will list the document you created in the **Uninstall** dialog box along with files created during the install procedure. **Therefore it is strongly suggested that you do not run any programs other than those related to the program you are installing until you have decided whether to uninstall.**
- The uninstall procedure does not let you restore files that are changed or deleted unless they are one of the special files that are backed up during initialization: autoexec.bat, config.sys, reg.dat, and the .ini files in your Windows directory.

Notes:

- The uninstall feature requires Windows 3.1 or Windows for Workgroups.
- The uninstall feature does not notice files or directories created from DOS boxes (after all, this is a Windows program!).
- The uninstall feature does not attempt to save information across sessions.
- The Install operation requires that the entire product being installed is distributed in one archive.
- WinZip determines whether an archive contains an install or setup program by checking for a file that 1) is executable, 2) has "install" or "setup" in the filename, and 3) does not contain directory information. If no file matches this criteria the Install operation is disabled.

[Questions and Answers About Install/Uninstall](#)

[Install Dialog Box](#)

[Uninstall Dialog Box](#)

Questions and Answers About Install/Uninstall

Here are answers to the three most frequently asked technical questions about WinZip's Install/Uninstall feature:

Question: Why shouldn't I run unrelated programs during an install?

Answer: All configuration changes made between an install and uninstall are considered to have been made by the install process. For example, if you switch to your word processor and save a document *during* the installation process, the document is considered to have been created as *part of* the install process. If you subsequently uninstall, WinZip lists the document you created in the **Uninstall** dialog box along with files created during the install procedure. Therefore it is strongly suggested that you do not run any programs other than those related to the program you are installing until you have decided whether to uninstall.

Question: What does WinZip do if a SETUP program replaces an existing DLL or VBX file?

Answer: WinZip's uninstall feature will never suggest you delete files that are used by other programs. WinZip "watches" the setup process, and notices whether any existing files were replaced. If you later choose to uninstall a program WinZip will list changes to pre-existing files in the Cautions dialog box, and will *not* list them in the Uninstall dialog box, so these files cannot be accidentally deleted. Since no well-behaved SETUP or INSTALL program will replace existing files with older versions of the same file, and since all well-behaved DLLs and VBXs are designed so that new versions don't break programs relying on old versions, there should be no negative effects on your system.

Note that WinZip does not backup all files on your system before running an install, so it is possible for an ill-behaved SETUP or INSTALL program to "break" other applications. *However, in no case will you be worse off running WinZip with the Install/Uninstall feature than if you run the SETUP or INSTALL program without WinZip.*

Question: Can I use WinZip to install a program, try the program for a week, and later use WinZip to uninstall it?

Answer: No. WinZip's Install/Uninstall feature was designed for the highest possible reliability. You must decide whether to uninstall in the same session as you install. The advantage to this approach is that WinZip has a very high uninstall success rate with a very easy to use interface. It is almost impossible to guarantee a safe uninstall if you've had a chance to install other programs, make arbitrary changes to your system configuration, etc. However, you can use the **Report** button in the WinZip Uninstall dialog box to generate a disk file listing files that were changed, and use this file to manually uninstall the program. In this case it is up to you to determine whether any programs you've since installed depend on files that are part of the original install.

Install Dialog Box

The Install dialog box initially gives you two choices:

The **Save Configuration Information for Possible Uninstall** check box determines whether WinZip will save information about your program groups, icons, and ini files. This information is required for an uninstall operation, so if this checkbox is not selected you will not be able to use WinZip to uninstall.

The **Minimize During Install** checkbox determines whether WinZip will be minimized while running the install program. If this checkbox is not selected you can activate WinZip after the installation by clicking on the WinZip window, using the Task List, or using the Alt-Tab keys. If this checkbox is selected WinZip will be minimized with the "always on top" attribute so that you can easily find it after you are done running the installation program and trying the application that was installed.

Press the **OK** button to begin the installation. WinZip will then extract all files into a temporary directory, optionally save system configuration information, and run the installation program.

After running the Install program the Install dialog box gives you two more choices:

Select the **View Configuration Options for Possible Uninstall** radio button to display the **Uninstall** dialog box.

Select the **No Uninstall Wanted** radio button if you do not want to uninstall.

Press the **OK** button after you have made your selection.

Uninstall Dialog Box

The Uninstall dialog box displays a list box containing one entry for each item that can be uninstalled. Entries are created for

- Groups and icons created by the installation process.
- Directories or files created by the installation process.
- Configuration files (e.g. win.ini) changed by the installation process.

Each entry contains a check box and a description of the action. Select or deselect the check boxes depending on whether you want to uninstall the configuration change. Usually it is best to remove all entries, however, this dialog box gives you a chance to avoid removing any files or icons you want to keep.

The **Select All** button selects all check boxes.

If a **Cautions...** button is displayed in the Uninstall dialog box press it for information about system configuration changes that the uninstall procedure cannot restore, for example, dynamic link libraries in your Windows that have been replaced.

Press the **Report...** button to save a list of the suggested actions to a disk file.

Press the **Uninstall** button to begin the uninstall, or **Cancel** to terminate the operation. Additional confirmation dialog boxes may be displayed depending on the specifics of the program being uninstalled.

Notes:

All actions in the Uninstall dialog box are automatically checked except file deletions. Individual files are not selected for deletion in case you created files using some other application during the install process; however, you can use the **Select All** button to quickly select all checkboxes in the list box.

If you decide to cancel the uninstall operation you may wish to create a report using the **Report...** button to assist a manual uninstall.

File Manager Interface

WinZip's File Manager Interface lets you open archives by double clicking in the File Manager, access WinZip through a pull-down menu to the File Manager, and automatically start and stop WinZip along with the File Manager.

You can also open archives by dragging them from the File Manager to a WinZip window, and can add files to an archive by dragging them from the File Manager to a WinZip window as described in the section [Drag and Drop Interface](#).

(Note: The File Manager pull-down menu is not available in WinZip for Windows/NT.)

Related Topics:

[File Manager Configuration Dialog Box](#)

[The WinZip File Manager Menu](#)

[File Manager Add Dialog Box](#)

File Manager Configuration Dialog Box

This dialog box is displayed when you select **File Manager Configuration** from WinZip's Options menu, when you select **Configuration** from the File Manager's WinZip menu, and during WinZip installation. The following choices are available:

- The **Associate WinZip With Archives** checkbox determines whether you will be able to double click on archives in the File Manager to open them. If this option is checked, the following extensions will be associated with WinZip: ZIP, LZH, ARJ, ARC, TAR, TGZ, TAZ, GZ, and Z. If this option is not checked, WinZip will ensure it is not associated with these extensions. See the section titled Windows Associations for more information on associations.
- The **Include WinZip In File Manager Menus** checkbox determines whether the WinZip menu entry is displayed on the File Manager menu bar.
- The **Start/Stop WinZip With File Manager** checkbox determines whether the File Manager automatically starts WinZip when the File Manager is started and closes WinZip when the File Manager is closed. This ensures that WinZip is always available for drag and drop operations from the File Manager.

(The second and third choices are not available in WinZip for Windows/NT.)

The WinZip File Manager Menu

The optional WinZip menu in the File Manager provides the following choices:

- The **Open Archive** entry will open the currently selected archive. If a WinZip task was started by the File Manager that task will open the archive, otherwise a new WinZip task will be started to open the archive.
- The **Add Files To Archive** entry adds the selected files to an archive. If a WinZip task was started by the File Manager that task will handle your Add request, otherwise a new WinZip task will be started. In both cases you will have the opportunity to specify which archive should receive the files you are adding.
- The **Configure** entry activates the File Manager Configuration dialog box (described above).
- The **About** entry displays a copyright notice.

File Manager Add Dialog Box

The File Manager Add dialog box is displayed when you use the **Add Files To Archive** entry in the File Manager's WinZip pull-down menu. For information on enabling and disabling this menu entry see the section titled [File Manager Configuration Dialog Box](#).

This dialog box lets you change the name of the open archive in one of two ways:

- 1) Type the name of the archive in the **Add to Archive** edit field.
- 2) Click on the **New...** or **Open...** buttons to activate the standard New and Open dialog boxes, respectively.

These shortcuts provide a quick way to add files to a different archive without going through the File pull-down menu.

See the section titled [Adding Files to an Archive](#) for a description of the options available in this dialog box.

Menu Tree

File Menu

| | |
|-------------------|--|
| New Archive... | open a new archive |
| Open Archive... | open an existing archive |
| Close Archive | close the open archive |
| Information... | display information about the open archive |
| Move Archive... | move archive to a different drive or directory |
| Copy Archive... | copy archive to a different drive or directory |
| Rename Archive... | change file name of an archive |
| Delete Archive... | delete archive |
| Exit | exit WinZip |

Actions Menu

| | |
|---------------|---|
| Add... | add files to the open archive |
| Delete... | delete files from the open archive |
| Extract... | extract files from the open archive |
| View... | view files in the open archive |
| Select All | select all files in an archive |
| Deselect All | deselect all files in an archive |
| Virus Scan | run a virus scan program against archive contents |
| Make EXE File | create a self-extracting archive |
| Test | test integrity of an archive |
| CheckOut... | examine and/or run programs in an archive |
| Install... | run "install" or "setup" program in archive |

Options Menu

| | |
|------------------------------|---|
| Configuration... | modify configuration options |
| Directories... | specify default directories |
| File Manager Configuration | configure WinZip File Manager interface |
| Font... | specify font for main window |
| Password... | set password for subsequent archive operations |
| Program Locations... | specify program names and paths |
| Sort | specify sort order for list of files in archive |
| Reuse WinZip Windows | don't open new windows when WinZip is started |
| Save Settings on Exit | control whether options are saved when WinZip is closed |
| Save Settings Now | save configuration settings immediately |
| Set Installation Defaults... | set options to original installation defaults |
| View Last Output... | view output from the last DOS command issued by WinZip |

Help Menu

| | |
|-----------------------|---|
| Contents | start Help and display topics in WinZip help file |
| Brief Tutorial | display brief WinZip tutorial |
| Hints and Tips | display hints and tips |
| Search for Help on... | open search dialog box for WinZip help |
| How to Use Help | display instructions for using help system |
| Ordering Information | display order form |
| About WinZip... | display copyright notice |

The File Menu

The following entries are available on the file menu:

- The **New Archive** menu entry creates new archives.
- The **Open Archive** menu entry opens existing archives.
- The **Close Archive** menu entry closes the currently open archive. This menu entry is included primarily for completeness, since the **New** and **Open** menu entries automatically close the open archive.
- The **Information** menu entry displays a dialog box with the archive format, full filename, actual archive size, number of files in the archive, average compression ration, and the date and time the archive was last updated.
- The **Copy Archive**, **Move Archive**, **Rename Archive**, and **Delete Archive** menu entries facilitate Archive Management.
- The **Mail Archive** menu entry, available only in configurations that include MAPI.DLL, makes it easy to mail an archive to another user.
- The **Exit** menu entry closes (terminates) WinZip.
- The last four archives you opened can be re-opened directly from the File menu.

Creating a New Archive

To create a new archive, select **New Archive** from the WinZip File pull-down menu. This activates the **New Archive** dialog box. Type the name of the archive you want to create. *Do not enter the name of the files you want to compress.* This dialog box works almost like the standard Windows **Open** dialog box. You can use the **Drives** and **Directories** list boxes to choose the drive and directory where the archive will be created. For example, to create an archive on your floppy drive select **A:** from the **Drives** drop-down list box. The names of any existing archives on the selected drive and directory will be listed in gray to help you choose a name that is not already in use.

Check the **Add Dialog** check box in the New Archive dialog box if you would like to automatically activate the Add dialog box after the new archive is opened.

To list self-extracting archives in the New and Open dialog boxes, select the entry that includes EXE and COM files in **List Files of Type** drop down list box. Note: When self-extracting archives are listed in the open dialog box, all EXE and COM files in the selected directory will be listed, even if they are not self-extracting archives. WinZip is not able to check whether a file is a self-extracting archive until it is opened.

Opening an Existing Archive

To open an existing archive, select **Open Archive** from the WinZip File pull-down menu. This activates the standard **Open Archive** dialog box. Then select the archive you want to open in the **Open** dialog box. Opening an archive is just like opening a document in Write or a spreadsheet in Excel; the only difference is that you open an archive instead of a document or spreadsheet. Use the **Drives** and **Directories** list boxes to select the appropriate directory and click on the archive in the **Archive Name** list box. Press the **OK** button when you have made your selection.

To list self-extracting archives in the New and Open dialog boxes, select the entry that includes EXE and COM files in **List Files of Type** drop down list box. Note: When self-extracting archives are listed in the open dialog box, all EXE and COM files in the selected directory will be listed, even if they are not self-extracting archives. WinZip is not able to check whether a file is a self-extracting archive until it is opened.

Archive Management

The **Copy Archive**, **Move Archive**, **Rename Archive**, and **Delete Archive** entries in the File menu facilitate archive management.

Copy Archive copies the open archive to another directory or disk. The **Copy** dialog box is displayed so you can choose the destination for the copy operation.

Move Archive copies the open archive to another directory or disk. The **Move** dialog box is displayed so you can choose the destination for the move operation.

Rename Archive gives you an opportunity to change the file name of an archive. The **Rename** dialog box lets you change the open archive's file name but not the filename extension (file type). Simply type the new file name and press the OK button.

Delete Archive deletes the open archive. A confirmation dialog is displayed to avoid accidental deletion. If you choose to continue the archive is closed and deleted.

Adding Files to an Archive

There are two ways to add files to an archive:

- 1) Use the Windows File Manager Drag and Drop Interface, as described in the section titled [Drag and Drop Interface](#).
- 2) Click on the **Add** push button or select the **Add** entry from the Actions pull-down menu to bring up the Add dialog box.

You can use the Add dialog box to choose the files added to an archive in two ways:

- 1) Type the name(s) of the files you want to add in the **Add Files** edit field and press the **Add** button. Standard MS-DOS wildcards are accepted, and multiple file names can be specified.
- 2) Select files in the **Select Files** [Extended Selection List Box](#) and press the **Add** button. Use the **Update List** button to update the list based on wildcards specified in the **Add Files** edit field.

The Add and Drop dialog boxes provides the following options:

- The **Action** drop down list provides four choices: Add, Freshen, Move, and Update. The Add option causes WinZip to add all specified files to the archive. The Freshen option causes WinZip to update files already in the archive that match the specified files. The Update option is the same as Freshen, but adds any specified files that are not already in the archive. The Move option is the same as Add, except that once the specified files have been successfully added to the archive they are deleted from disk. When using PKZIP to create archives these options correspond to the PKZIP -a, -f, -mu, and -u options if you are working with a ZIP file. They correspond to the LHA and ARJ a, f, m and u options when working with LZH and ARJ files, respectively.
- The **Compression** drop down list determines the compression method. This field is disabled when working with LZH files. Faster compression options usually result in larger archives.
- The **Multiple Disk Spanning** drop down list determines whether the archive can span multiple floppy disks. Be sure to read the section titled [Multiple Disk Spanning](#) for more information on this feature before using it.
- The **Recurse Subdirectories** check box determines whether WinZip recursively traverses all subdirectories underneath the specified directory when looking for files to add. This provides an easy way to backup all files in a branch of a directory tree. When using external programs to create archives this option corresponds to the PKZIP -r -p options, the LHA /r1x1 option, or the ARJ -r option.
- The **Save Extra Directory Info** causes WinZip to store any directory path information specified in the **Add Files** edit field. When using PKZIP to create ZIP files option corresponds to the PKZIP -P option. When working with ARJ files this check box prevents WinZip from specifying the e option.

Note: To restore a branch of a directory tree added with the **Recurse Subdirectories** option, be sure to select the **Use Directory Names** check box in the [Extract](#) dialog box.

- The **Store Filenames in DOS 8.3 Format** checkbox causes WinZip to store the short 8.3 MS-DOS compatible form of any long filenames. "8.3" refers to the maximum of 8 characters in the filename portion of the name and 3 characters in the extension, for example, "12345678.123". This option is only available in Win32 versions of WinZip.

Deleting Files from an Archive

Select **Delete** from the Actions menu to activate the **Delete** dialog box. There are two ways to delete files:

- 1) First select entries in the list box, then select the **Delete** entry from the Actions pull-down menu.
- 2) Select the **Delete** entry from the Actions pull-down menu to bring up the Delete dialog box. You can then specify the file names you want to delete (standard MS-DOS wildcards are accepted). You can specify multiple file names, separated by spaces.

To delete an entire archive select the **Delete** entry from the Actions pull-down menu to bring up the Delete dialog box. Then select the **Entire Archive** radio button and click on the **Delete** push button. Alternatively, you can select **Delete Archive** from the File menu.

Extracting Files from an Archive

Use the **Extract** button on the toolbar or select **Extract** from the Actions menu to display the Extract dialog box. Use the Extract dialog box to extract or "unzip" files in the open archive to your hard disk.

WinZip extracts files from the archive to the directory specified in the **Extract To** field. You can specify this directory in one of four ways:

1. Select a directory and drive in the **Directories/Drives** list boxes
2. Type a directory name in the **Extract To** field
3. Pull down the **Extract To** combo box and select a directory from the list of previous **Extract To** directories
4. Press the **Create Dir...** button and create a directory

The Extract dialog box provides the following options:

- The **Selected Files** radio button instructs WinZip to extract only files that are selected in the main WinZip window. See the section titled [Using Extended Selection List Boxes](#) for information on selecting multiple files. This option is disabled if no files are selected.
- The **All Files** radio button instructs WinZip to extract all files in the archive.
- The **Files** radio button and edit field allow you to specify which files are extracted using filenames or standard MS-DOS wildcards, for example, "*.XLS *.DOC" (don't type the quotes).
- The **Overwrite Existing Files** check box determines whether you are prompted before existing files are overwritten with files in the archive. It corresponds to the PKUNZIP -o option, the LHA /m1 option, and the ARJ -y option.
- The **Use Directory Names** check box determines whether WinZip will use directory names (also known as path names) stored in the archive. You will probably want to check this option for most extract operations. If this option is checked any directory names stored in the archive will be appended to the **Extract To** directory when appropriate. *If this option is not checked all files will be extracted to the same directory, regardless of any directory names in the archive.*

For example, assuming the **Extract To** directory is "c:\temp", the file "mydir\filename" will be extracted to the directory "c:\temp\mydir" if the **Use Directory Names** option is checked, or the directory "c:\temp" if the option is not checked.

This option corresponds to the PKUNZIP -d -p options, the LHA x option, and the ARJ x option.

- The **Create Dir** button activates the [Create Directory](#) dialog box. Note that you can extract files and create a directory in without this dialog box: simply type the name of the new directory in the **Extract To** field of the Extract dialog box and press the **Extract** button.

Notes:

- You can also extract files using the Drag and Drop Interface as described in the section titled [Extracting Files from an Archive with the Drag and Drop Interface](#).
- You can change the default **Extract To** directory using the [Directories](#) dialog box.

Built-in Zipping and Unzipping

WinZip will normally add files to a ZIP and extract files from a ZIP *without* running PKZIP and PKUNZIP. Instead, it uses built-in zipping and unzipping. You can switch to other windows while the built-in zipping and unzipping are running. You can interrupt the process by pressing the Esc key or clicking in the WinZip window. Built-in zipping and unzipping generally save time because there is no need for WinZip to start external DOS programs. However, on some machines (particularly on slower systems) you may get faster turnaround by disabling this feature. To disable this feature turn off the **Use Internal Zipping** and **Use Internal Unzipping** checkboxes in the Configuration dialog box.

ZIP files created by WinZip's built-in zipping are 100% PKZIP 2.0 compatible.

Built-in unzipping is **not** used in the following circumstances:

- The ZIP contains files created by a version of PKZIP other than 1.1 or 2.0.
- The ZIP spans multiple disks
- The ZIP contains password protected files.
- The **Use Internal Unzipping and Zipping** checkbox in the Configuration dialog box is not selected.

In these cases WinZip will automatically run PKUNZIP.

Built-in zipping is not used in the following circumstances:

- One of the disk spanning options was specified in the Add or Drop dialog box.
- A password was specified in the Password dialog box.
- The **Use Internal Unzipping and Zipping** checkbox in the Configuration dialog box is not selected.

In these cases WinZip will automatically run PKZIP.

Viewing Files in an Archive

You can view files in an archive in several ways:

- With the **View** button in the toolbar or the **View** entry in the Action pull-down menu. This activates the View Dialog Box.
- With the features described in the section titled CheckOut Feature.
- Most files can be viewed by double clicking on the file name in the main window's list box, as described in the section titled Double Clicking

View Dialog Box

When you push the **View** button in the toolbar choose the **View** entry in the Action menu the View dialog box is displayed. This dialog gives you a choice of viewing the selected file(s) in one of three ways:

- 1) Using the associated program. The associated program is listed in parenthesis. This method is similar to double clicking on a file in the main window unless the file is executable; in that case the file is opened with the program specified in the **Default Association** field in the Program Locations dialog box.
- 2) Using the built-in internal ASCII text viewer. Multiple files can be viewed in one view operation using this viewer.
- 3) With any viewer available on your system. You must specify the name of the viewer.

Built-In Viewer

The built-in ASCII text viewer can be used to view files in an archive, and is used view the results of the last operation using the **View Last Output** entry in the Options pull-down menu.

Unlike most dialog boxes, the viewer window can be resized and maximized.

Click on the **Clipboard Copy** push button to copy selected text to the system clipboard. If no text is selected all the text is copied to the clipboard.

Notes:

- Due to limitations in the standard Windows multi-line edit control, the built-in text viewer only displays the first 32K of a file. However, you can view larger files by double clicking on files in the main WinZip window or by using the CheckOut facility.
- The viewer is limited to plain ASCII text, just like the Windows Notepad application.

Select All and Deselect All

The **Select All** and **Deselect All** menu entries in the Actions menu select and deselect all files in the main window's list box. Selected files can be easily deleted, extracted, or viewed.

Virus Scan

Use the **Virus Scan** entry in the Actions pull-down menu to determine whether files in the archive contain viruses. To use this feature a virus scanner must be configured, as described in the section titled [Virus Scanner Configuration](#). Note that the [CheckOut](#) feature also provides optional virus scanning.

The Virus Scan operation performs the following actions:

- 1) Creates a temporary directory
- 2) Extracts all files in the current ZIP to the temporary directory
- 3) Runs the virus scanner against files in the temporary directory
- 4) Deletes all files in the temporary directory and removes the temporary directory
- 5) Displays the results of the scan operation in the View window

Creating a Self-Extracting Archive

Use the **Make .EXE File** entry in the Actions menu to convert the open archive to a self-extracting archive. Self-extracting archives have an extension of .EXE, and can be run as commands from the DOS prompt. When a self-extracting archive is run, the files in the archive are automatically extracted. This is convenient, because the PKUNZIP.EXE, LHA.EXE, or ARJ.EXE are not needed to extract files from these self-extracting archives.

The **Make .EXE File** operation requires an external program. For more information on supported external programs, including information on obtaining these programs, see the sections titled System Requirements and Installing Optional External Programs.

When working with a ZIP file, this operation runs the ZIP2EXE program. **Note: be sure to use version 2.0 or later of ZIP2EXE, otherwise you will get the message "don't know how to handle file" when running the self-extracting archive.**

When working with an LZH file, this operation runs the LHA program with the s option.

When working with an ARJ file, this operation runs the ARJ program with the y option.

You can use WinZip to add, delete, extract, view, and run files in a self-extracting archive the same way you can manipulate a normal archive. Self-extracting archives are automatically listed in the Open dialog box if the appropriate options are selected, as described in the section titled The File Menu.

Note: If the *first* file in a self-extracting LZH file is named "!" (i.e. an exclamation mark is the only character in the filename) this file will be displayed when the self-extracting executable is run. To ensure that this file is the *first* file in the archive create a new LZH file, then add the "!" file (do not add other files in this step), and finally add the remaining files.

Testing an Archive

Use the **Test** entry in the Actions pull-down menu to test the integrity of the open archive. A dialog box is displayed with the results of the test operation. This command does not require an external program when working with ZIP files. This command runs LHA t for LZH files, and ARJ t for ARJ files.

Press the Esc key during the Test operation to terminate the integrity test.

CheckOut Feature

The CheckOut feature makes it easy to examine and/or run files in an archive. It creates a Program Manager group containing one icon for each file in the archive. Double click on the icon in the Program Manager group to run the file or to view the file with the program associated with the file (associations are described in the section titled [Windows Associations](#)). WinZip will optionally delete the Program Manager group and related files when you close the archive or close WinZip.

CheckOut Dialog Box

Use the **CheckOut** toolbar button or the **CheckOut** entry in the Actions pull-down menu to activate the CheckOut dialog box. This dialog box lets you configure these aspects of the operation:

- Use the **Directory** edit field to specify the temporary CheckOut directory name. This directory will be created if it does not already exist. The suggested directory depends on the setting of the **CheckOut Base Directory** in the [Directories](#) dialog box.
- Use the **Group Name** edit field to specify the name used for the Program Manager group.
- Use the **Icon Maximum for CheckOut Group** edit field to specify the maximum number of icons for the Program Manager CheckOut group. The Windows Program Manager limits you to 50 entries, but you may prefer a lower number to save time.
- The **Run Virus Scanner** check box lets you specify whether WinZip will run a virus scanner on the files in the archive. This option is disabled unless a virus scan utility is installed in the [Program Locations](#) dialog box.
- The **Create Icons For Programs And Documents Only** check box lets you control whether WinZip creates icons for all files in the archive or only for the specified files. When this option is selected, icons are created for executable files and files with [associations](#). Icons are also created for any files with names starting with "read" (in order to catch files with names like "readme.1st", "read.me", etc.).

Operations performed by the CheckOut feature:

When you click on the **OK** button in the CheckOut dialog box, WinZip performs the following operations:

- 1) If the specified directory exists and contains files WinZip will delete the files if you give it permission. Otherwise the directory is created. This ensures that the directory contains only files from the current archive.
- 2) If the specified program group exists WinZip will delete the group if you give it permission. This ensures that the group contains only icons for files in the current archive.
- 3) WinZip extracts files in the current archive to the specified directory.
- 4) If the **Run Virus Scanner** check box is selected your virus scanner is run against all files in the specified directory. If the virus scan utility returns a non-zero error level, the CheckOut operation is aborted and messages from the scanner are displayed.
- 5) WinZip creates a new Program Manager group containing appropriate the icons.

Using the Program Manager group created by CheckOut:

The Program Manager group created by CheckOut works like all other Program Manager Groups. WinZip sets up this Group with icons for each file so that you can use them as follows:

- If a file is executable, double clicking on the icon runs the program.
- If a file has an association, double clicking on the icon loads the file in the associated program so you can view the file.
- Otherwise, double clicking on the icon loads the file in the WinZip Default Association program specified in the Program Locations dialog box.

Options

Use the **Configuration** entry in the Options pull-down menu to activate the Configuration dialog box. This dialog box lets you specify miscellaneous WinZip configuration information, including the default archive format and options controlling the appearance of WinZip windows.

Use the **Directories** entry in the Options pull-down menu to activate the Directories dialog box. This dialog box lets you specify the initial WinZip working directory, the default Extract directory, and an optional temporary directory for use while creating archives.

Use the **Font** entry in the Options pull-down menu to activate the Font dialog box. This standard dialog box lets you specify which font is used for the list of files in an archive.

Use the **Password** entry in the Options pull-down menu to activate the Password dialog box. This dialog box lets you set a password for the open archive.

Use the **Program Locations** entry in the Options pull-down menu to activate the Program Locations dialog box. This dialog box lets you specify the location of external programs, including PKZIP and your default file viewer.

The **Sort by** entries in the Options pull-down menu let you specify whether the list of files in the archive is sorted by name, path, type, size, compression ratio, compressed size, date, or whether the original archive order should be used. **Note:** You can also change the sort order by clicking on the appropriate portion of the main list box header. For example, click on the word "Date" in the header to sort by date.

The **Reuse WinZip Windows** entry in the Options pull-down menu determines whether new windows are opened when you start WinZip by double-clicking in the File Manager or Program Manager. When this entry is checked, existing WinZip windows are used. When this entry is not checked, a new WinZip windows is created. The advantages to reusing WinZip windows include: double clicking acts the same as drag and drop, and you never accidentally wind up with multiple WinZip windows.

The **Save Settings on Exit** entry in the Options pull-down menu determines whether options are automatically saved when WinZip is closed.

The **Save Settings Now** entry in the Options pull-down menu saves the options immediately. Options that are saved and restored include all the options in the Options pull-down menu, all options in the Add, Configuration, and Extract dialog boxes, and the current screen size and location. The options in the Directories Dialog Box and the Program Locations Dialog Box are saved regardless of the whether **Save Settings on Exit** is checked.

The **Set Installation Defaults** entry in the Options pull-down menu sets all configuration options and directory names to the original installation defaults.

Use the **View Last Output** entry in the Options pull-down menu to display the results of the last command issued by WinZip.

Configuration Dialog Box

Select **Configuration** from the Options menu to activate the Configuration dialog box. This dialog box lets you specify

- Whether the normal prompt dialog boxes are displayed in the following circumstances:
 1. When a file is dropped on WinZip. If no prompt is displayed, the file is automatically added to the open archive using the options last specified in the Drop dialog box. Note that when an archive is dropped on WinZip the archive is opened regardless of this setting.
 2. When a file is dragged from WinZip to another application. If no prompt is displayed, the file is automatically extracted using the options last specified in the Extract dialog box.
 3. When the **View** button is pushed. The selected file(s) are automatically viewed. Note that when **View** is selected from the Action pull-down menu this setting is ignored.
 4. When the **Extract** button is pushed. The selected file(s) are automatically extracted using the options last specified in the Extract dialog box. Note that when **Extract** is selected from the Action pull-down menu this setting is ignored.
- The Default Archive Format. This format is used when you specify the name of an archive without an extension while creating or opening an archive, and when creating an archive with an extension other than .ZIP, .LZH, or .ARJ.
- Whether WinZip should automatically show the Open Archive dialog box when you start WinZip.
- Whether WinZip should try to use Built-in Zipping and Unzipping when possible, instead of running PKUNZIP.
- Whether WinZip should beep after archive operations that take more than one second to complete.
- Whether the background on the header is displayed in light or dark gray.
- Whether "Smart DOC Handling" is enabled. This feature is described in the section titled Double Clicking.
- Whether the right mouse button displays a pop-up menu or is used to select files in the main WinZip window.
- Whether WinZip should enable/disable PKZIP 2.0's use of DPML, EMS, and XMS, and whether the PKZIP "slow memcopy" switch should be used. PKWARE recommends that DPML and XMS be disabled under Windows. See your PKWARE documentation for details on these settings.
- Whether WinZip should maintain a log of all error messages and all external commands it issues. Examples of external commands are PKZIP, LHA, and ARJ. You can specify the drive used for the log file. The log is written to the file WINZIP.LOG in the root directory of the selected drive.
- Whether WinZip should list the files in the archive in lowercase for improved legibility.
- Whether WinZip should have the "always on top" attribute, so that it is not overlaid by normal windows.
- Whether a Carriage Return character should be inserted in front of LineFeed characters that are not already preceded by a Carriage Return character when extracting or viewing files in TAR format archives. This option can be useful when a TAR file contains Unix-style text files. Unix text files usually contain lines ending in LineFeed characters only. The standard Windows Notepad program and many other Windows programs require a Carriage Return and LineFeed at the end of each line. This option is checked by default. You will want to uncheck this option when working with binary files (e.g. picture files).
- Whether WinZip displays large push buttons. The default for this setting depends on your video setup.
- Whether compressed file sizes and the compression ratio should be displayed in the main WinZip listbox.

- Whether icons are shown next to each entry in the main listbox indicating whether a file is executable or has an association.
- Whether WinZip should display 3D dialog borders instead of the normal dialog borders.

Directories

Select **Directories** from the Options menu to display the Directories dialog box. This dialog box lets you specify the following information:

Start-up Directory

Unless you start WinZip by double clicking on an archive, WinZip will optionally change to a directory of your choice when it starts up. Files in this directory are automatically displayed in the **Open Archive** and **New Archive** dialog boxes. The following choices control which directory is used.

- **System default** - WinZip does not change directories, so the system default directory will be in effect. Usually this will be the directory containing WINZIP.EXE.
- **Last Open Archive** - WinZip will change to the directory containing the last open archive during your last WinZip session.
- **Directory:** - WinZip will always change to the specified directory.

Default Extract Directory

These selections determine the default directory WinZip automatically inserts into the **Extract To** field in the Extract dialog box. You can, of course, type over this default directory name or select a different directory from the directory listbox.

- **Open Archive Directory** - WinZip will insert the name of the directory containing the open archive into the **Extract To** field. For example, if the archive c:\download\tools.zip is open, WinZip will insert c:\download.
- **Last Extract Directory** - WinZip will insert the name of the directory you used during the last Extract operation. This value is saved when you exit WinZip so you can use it during your next WinZip session.
- **Directory:** - WinZip will always insert the specified directory. This value is saved when you exit WinZip so you can use it during your next WinZip session.

Default Add Directory

These selections determine the default directory when the Add dialog is opened.

- **Open Archive Directory** - WinZip will use directory containing the open archive.
- **Last Add Directory** - WinZip will use the directory you used during the last Add operation. This value is saved when you exit WinZip so you can use it during your next WinZip session.
- **Directory:** - WinZip will always use the specified directory. This value is saved when you exit WinZip so you can use it during your next WinZip session.

Optional Working Directory

If specified, temporary ZIP files are created in this directory. If this option is not specified temporary ZIP files are created in the directory containing the open ZIP file. This option is particularly useful when updating an archive when there is not enough room on the destination drive for both the original archive and the updated archive. This is most likely to occur when working with removable media (e.g. floppy disks). You can tell WinZip to use this feature only when working with removable media by checking the **Use for Removable Media Only** checkbox.

When using PKZIP to create an archive WinZip specifies this directory name via the -b switch. When using ARJ to create an archive WinZip specifies this directory name via the -w switch.

CheckOut Base Directory

If specified, WinZip uses this directory as the prefix for the default directory in the CheckOut dialog box. If this field is left blank WinZip will instead use the directory containing the open archive.

Temp Directory

This entry specifies the location for temporary files created by WinZip, including files created during the

View and Virus Scan operations. If you run out of disk space during a View or Scan operation, change the Temp Directory to specify a drive and directory with sufficient free space.

Password Protection

Files in ZIP and ARJ archives can be password protected by specifying a password in the Password dialog box. To access this dialog box use the **Password** entry on the Options pull-down menu.

If a password is specified then the password will be used to encrypt and decrypt files subsequently added to the archive or extracted from the archive. This feature can be useful to protect data when storing archives with sensitive information in unsecured places.

If a password is active the Add dialog box title will indicate that files will be password protected. The main WinZip window lists password protected files with a plus sign following the filename.

To use password protection:

1. Open or create an archive. If you are using the New dialog box uncheck the **Add Dialog** checkbox on the right of the dialog box.
2. Select **Password** from the Options pull-down menu, specify a password, and press **OK**.
3. Perform any action, e.g., View, Extract, Add, or Drag and Drop.

Notes:

Passwords are cleared (reset so that no password is in effect) when an archive is closed or another archive is opened.

If a ZIP file contains password protected files, PKUNZIP is always used to extract files.

Be sure to remember any passwords you use! If you forget a password then files protected by the password cannot be recovered!

Program Locations

Select **Program Locations** from the Options menu to activate the Program Locations dialog box. This dialog box lets you specify the paths and filenames for the optional external programs supported by WinZip. Note that these programs are not required for most operations involving ZIP files.

If you are installing WinZip and are not familiar with these programs just press the **OK** button to continue the installation procedure.

External programs are not distributed with WinZip. For more information on these programs, including availability and minimum version numbers, see the section titled [System Requirements](#). For a step by step example of installing an external program see the section titled [Installing Optional External Programs](#).

When WinZip is installed it will attempt to locate the default programs in the directories specified in your PATH= environment variable. If it cannot find these programs, it will leave the corresponding edit fields blank.

If a program is not installed on your system, just leave the corresponding edit field blank. Otherwise, fill in the program name. The extension defaults to EXE. If no path is included for an entry, WinZip assumes the program is in a directory specified in your PATH= environment variable.

See the section titled [Virus Scanner Configuration](#) for information about that portion of the Configuration dialog box.

Example:

The first entry in the dialog box, for PKZIP, can have one of three values:

| Value | Description |
|---------------------|--|
| PKZIP.EXE | If the entry is blank, WinZip assumes PKZIP is not installed on your system. Just the filename is needed if PKZIP.EXE is in a directory specified in your PATH= environment variable. |
| C:\PKWARE\PKZIP.EXE | The full drive, directory, and filename are required if PKZIP.EXE is not in a directory specified in your PATH= environment variable. Note that C:\PKWARE is just an example, any other directory can be used. |

Default Association

The program specified as the **Default Association** is used when viewing a file that does not have an association. For additional information on associations, see the section titled [Windows Associations](#).

The defaults for this field are:

- SCCVAPI.EXE, System Compatibility Corporation's "Outside In" file viewer, if it is found in a directory specified by your PATH= environment variable.
- NVIEWER.EXE, the Norton Desktop for Windows File Viewer, if it is found in a directory specified by your PATH= environment variable.
- WNFV.EXE, the PC Tools for Windows File Viewer, if it is found in a directory specified by your PATH= environment variable.
- NOTEPAD.EXE, the Windows Notepad program, if NVIEWER and WNFV are not found.

Almost any other file viewer or editor can be used.

Virus Scanner Configuration

WinZip supports many virus scanners that can be run from Windows or the DOS command line, with a few important limitations noted below.

Virus scanner configuration is done from the Program Locations dialog box. Select **Program Locations** from the Options menu to activate this dialog box.

WinZip will automatically search for and detect the virus scanners listed below. If one of these programs is in a directory specified by your PATH= environment variable when WinZip is first installed, WinZip will automatically fill in the Program Locations dialog box with the appropriate options from the table below. There is no need to modify these parameters.

| Scanner | Parameters |
|-------------|----------------------|
| NAVW.EXE | /auto *.* /S |
| WNAPVIR.EXE | /QM/M-/B- *.* |
| NAV.EXE | *.* /m- /s |
| CPAV.EXE | *.* /P |
| MSAV.EXE | *.* /P |
| SCAN.EXE | /nomem *.* /ALL /SUB |

Note! McAfee SCAN 2.1 parameters are *incompatible* with prior versions of SCAN. Version 2 requires the /ALL parameter while version 1 requires /A. Be sure to use /A or /ALL as appropriate depending on your version of SCAN.

If you have installed one of these virus scanners in a directory that is not specified by your PATH= environment variable you can configure the virus scanner by setting the following fields in the Program Locations dialog box:

- 1) The **Scan Program** edit field should contain the full name of the scanner, including subdirectory information.
- 2) The **Parameters** edit field should contain the appropriate parameters from the list above.
- 3) Unless running the NAVW or WNAPVIR scanners the **Run in iconized DOS session if possible** check box should be checked.

Note: the WNAPVIR scanner does not issue any messages unless a virus is detected. In this case WinZip will issue a message indicating that the virus scan was completed.

Do not use WinZip's virus scanning support with a different virus scanner unless you have read and understood the information the sections "Configuring Windows Virus Scanners" or "Configuring DOS Virus Scanners".

Related Topics:

[Configuring Windows Virus Scanners](#)

[Configuring DOS Virus Scanners](#)

Configuring Windows Virus Scanners

To configure WinZip for an unsupported Windows based virus scanner, first ascertain that the virus scanner reports suspected viruses by displaying a dialog box. If the scanner simply writes to a log file you (and WinZip) will not know about the problem. Then fill in the following fields in the Program Locations dialog box:

- 1) The **Scan Program** field should contain the name of the program (the full path name is required if the program is not in a directory specified in your PATH= environment variable).
- 2) The **Parameters** field should contain the appropriate parameters to run the virus scanner. The rules for Windows virus scanner parameters are:
 - a) Use *.* to indicate where WinZip should substitute the drive and directory of the files that are to be scanned.
 - b) If you do not specify *.* , or do not specify any parameters, WinZip will append the filenames to be scanned at the end of the scanner command line.
 - c) Be sure to specify any parameters necessary to cause the scanner to check subdirectories of the drive and directory of the files that are to be scanned.
- 3) The **Run as iconized DOS session if possible** check box is ignored when using a Windows based virus scanner, so you do not need to change this check box.

Be sure to check your virus scanner documentation for important parameters. For example, the NAVW scanner from Symantec does not automatically scan subdirectories, so you must specify the /S parameter.

Configuring DOS Virus Scanners

To configure WinZip for an unsupported DOS based virus scanner, fill in the following fields in the Program Locations dialog box:

- 1) The **Scan Program** field should contain the name of the program (the full path name is required if the program is not in a directory specified in your PATH= environment variable).
- 2) The **Parameters** field should contain the appropriate parameters to run the virus scanner. The rules for DOS virus scanner parameters are:
 - a) Use *.* to indicate where WinZip should substitute the drive and directory of the files that are to be scanned.
 - b) If you do not specify *.* , or do not specify any parameters, WinZip will append the filenames to be scanned at the end of the scanner command line.
 - c) Be sure to specify any parameters necessary to cause the scanner to check subdirectories of the drive and directory of the files that are to be scanned.

Also be sure to check your virus scanner documentation for important parameters. For example, the McAfee SCAN program normally only checks .EXE and .COM files for viruses, so the /A parameter is specified for additional protection.

- 3) The **Run as iconized DOS session if possible** check box determines whether WinZip will run a DOS based virus scanner as an icon if you are running Windows in Enhanced Mode. This parameter is ignored when using a Windows-based virus scanner. (Note: in Windows Standard mode DOS applications can only be run in full-screen mode.) Do not select this check box unless you are running one of the scanners listed above, or are sure you understand the following information!

The **Run as iconized DOS session if possible** check box should only be used under the following circumstances:

- 1) The scanner is configured to run in "batch" mode, without any prompts. If the scanner requires any keyboard input when running as an icon, you will not be able to see the prompts, and the session will appear to be hung.
- 2) The scanner writes all messages through DOS. Messages written directly to the video buffer are not captured by WinZip and will be lost. To determine whether a scanner writes messages through DOS, run the scanner with its output redirected (for example, issue the command "scan > nul"). Any messages you see during this test will not be captured by WinZip.
- 3) The scanner returns a non-zero error level if it encounters any problems. If the scanner does not return a non-zero error level, WinZip will assume the files passed the virus check, and any warnings issued by the scanner will be lost. (Note: if the scanner returns a non-zero error level, WinZip automatically displays all messages written to standard error or standard output.)

Create Directory

This dialog box lets you create a directory. This directory becomes a subdirectory of the current directory unless you specify a path.

Double Clicking

Double clicking on a filename listed in the main WinZip window will perform the same action as when you double click on a file in the File Manager. If the file is executable (has a filename extension of EXE, COM, BAT, or PIF) WinZip will run it. Otherwise WinZip will open the file with the appropriate application. For example, files with a filename extension of .WRI are opened by the Windows Write application. The appropriate application is determined via Windows Associations. If no application is associated with the file, WinZip will run the program specified as the **Default Association** in the Program Locations dialog box. If you modify the file while viewing it, WinZip will offer to add the modified file to the archive.

If the **Smart DOC Handling** option in the Configuration dialog box is enabled and you double click on a file with a file type of .DOC, WinZip will run one of two programs:

- 1) If the .DOC file looks like plain ASCII text WinZip will run the program specified as the **Default Association** in the **Program Locations** dialog box.
- 2) If the .DOC file looks like a file created by a word processor WinZip will run the program associated with .DOC files.

Smart Doc Handling avoids the overhead of loading a word processor like Word for Windows when viewing ASCII text files like "readme.doc".

Note: Pressing the Enter key performs the same action as double clicking.

Windows Associations

Microsoft has defined the word "associate" as follows:

To identify a filename extension as belonging to a certain application, so that when you open any file with that extension, the correct application is opened automatically.

For example, by default, Windows associates .WRI files with the WRITE application, and .CRD files with the CARDFILE application. Most Windows application installation procedures create associations. For example, Word for Windows creates an association for .DOC files, while WinZip creates associations for files with the extensions ZIP, LZH, ARJ, ARC, TAR, TGZ, TAZ, GZ, and Z.

WinZip uses associations when you Double Click on a filename listed in the main WinZip window and when you use the CheckOut Feature.

WinZip, the Program Manager, and the File Manager all use associations the same way. When you double click on a file with an association, the application associated with the file is run, and the application automatically opens the file. The WinZip CheckOut facility establishes associations when it updates the Program Manager CheckOut group for two reasons: to display the right icon for each file, and to ensure that the appropriate application is run when you double click on an icon.

You can view or add associations using the **Associate** entry in the File Manager's File pull-down menu as follows: start the File Manager and select a filename with the extension you are interested in. Then choose the **Associate** entry in the File Manager's File pull-down menu. The File Manager will display the Associate dialog box showing the currently associated program. To change the association type the program name in the edit field and choose **OK**.

Note: For more information on associations press the F1 key or **Help** button while the File Manager's Associate dialog box is displayed.

Using Extended Selection List Boxes

WinZip uses Extended Selection List Boxes for the list of files in the open archive and for the list of files in the Add dialog box. You can select files from an Extended Selection List Box the same way as you select files in the File Manager.

To select an individual file in an Extended Selection List Box, click on the file. This cancels all previous selections. To select two or more files in sequence click on the first file, then press and hold down the Shift key while you click on the last file in the group. To select two or more items out of sequence press and hold down the Ctrl key while you click on each file.

In addition to the aforementioned standard methods for working with Extended Selection List Boxes, you can use the right mouse button to select files without canceling previous selections. This feature was added for compatibility with Norton Desktop for Windows.

You can use the **Select All** and **Deselect All** entries in the Actions pull-down menu to select and deselect all files in an archive.

The keyboard interface for Extended Selection List Boxes is described in the section titled [Keyboard Usage](#).

Multiple Disk Spanning

The "Multiple Disk Spanning" features allows you to create and access archives that span multiple floppy disks. This feature is useful when the data being archived does not fit on one floppy disk. It is available via the Add and the Drop dialog boxes.

Requirements for multiple disk spanning:

- 1) You *MUST* create (or open) an archive on a floppy drive *before* using this feature, otherwise multiple disk spanning options are disabled.
- 2) If you are working with a ZIP file you *MUST* have PKZIP installed in the Program Locations dialog box. PKZIP 2.04g or later is *REQUIRED* for multiple disk spanning of ZIP files. See the section titled System Requirements for details on this requirement.

Note the following restrictions:

- ZIP files: Any files in the open archive will be replaced (a confirmation dialog is displayed before data is replaced). If any of the "destructive" spanning options (e.g. "format" or "wipe disk") are specified, all data currently on the disk will be lost. For details on the options, see the "Backup Guide" in your PKZIP documentation.
- ARJ files: WinZip automatically provides non-destructive disk spanning for ARJ files on removable media by using the -vva option for add, move, freshen, and update operations.
- LZH files: The LZH format does not support disk spanning.

Problem Solving:

If the **Multiple Disk Spanning** options in the Add and Drop dialog boxes are disabled even when the above requirements are met, check the date/time stamp on your PKZIP.EXE. You can check the date/time stamp as follows:

1. Activate the File Manager.
2. Navigate to the directory containing PKZIP.EXE.
3. Select **All File Details** from the File Manager's View pull-down menu.

WinZip uses the date/time stamp on your PKZIP.EXE to determine whether you have the correct version of PKZIP installed. All official versions of PKZIP 2.04g are dated 28-Dec-92 or later. If your PKZIP.EXE is dated prior to 28-Dec-92 you should reinstall PKZIP to solve this problem.

Enhanced and Standard Modes

In Windows 386 Enhanced mode PKZIP, PKUNZIP, LHA, and other optional programs run by WinZip are executed in the background in an iconized DOS session. While these commands are running you can switch to another window using the Task Manager or by clicking on the desired window. An hourglass pointer is used to indicate that the WinZip window is busy. You can double click on the icon titled "WinZip running DOS commands" to monitor the command's progress. If any of these commands prompts the user for input, WinZip will automatically bring the DOS session to the foreground.

Unfortunately, Windows does not allow you to execute these commands in the background under Standard mode. In Standard mode your screen will be cleared, and these commands will be run in a full screen DOS session.

In all cases you can view the messages displayed by the last command issued by WinZip by selecting View Last Output in the Options pull-down menu.

Your Windows User's Guide contains descriptions of Enhanced and Standard modes. You can determine which mode is active by choosing the **About** entry in the Program Manager's Help pull-down menu.

Norton Desktop For Windows

NDW 3.0 Notes:

- You can open archives with WinZip by double clicking in the NDW Drive Window if you turn off the **Show Zips As Directories** entry in the Drive Window's **Tree** menu. Be sure to save your NDW settings after making this change.
- If you installed NAVW as your WinZip virus scanner while running NDW 2.0, you will have to change the **Virus Scanner Parameters** in WinZip's Program Locations dialog box. Simply remove the **/auto** portion of the parameters. This switch is still required for earlier versions of NAVW.
- The initial release of the German version of NDW 3.0 has a bug that prevents the CheckOut and Install options from creating program groups. Symantec is working on a fix.
- The features described in the section titled File Manager Interface all work with Norton Desktop drive windows. Note: if you have added the MaxWinFileExtensions=0 line to your NDW.INI the WinZip menu will not be displayed in NDW drive windows. In this case you'll have to increase the value of this configuration option to see the WinZip menu.

NDW 2.0 Notes:

- Several Norton Desktop 2.x users have reported that the WinZip CheckOut feature sometimes places icons into the wrong group. This is apparently caused by a bug in NDW 2.x. This problem is easy to fix: select **Quick Access** from the NDW Window pull-down menu to display all groups. Delete any duplicate groups, or groups that should not be listed (e.g. groups for products that have been uninstalled). Then select **Save Configuration** from the NDW Configuration pull-down menu. At this point the problem should not re-occur. If you can reliably reproduce this problem after taking the steps described above, please send mail to the address in the WinZip About dialog box.

Keyboard Usage

WinZip is easier to use with a mouse, but you can also use the standard Windows keyboard interface. Keyboard accelerators defined for WinZip include:

| | |
|----------------------|---|
| Ctrl+N | Create new archive. |
| Ctrl+O | Open an existing archive. |
| Ctrl+L | Close archive. |
| Ctrl+F | Display Information about the open archive. |
| F7 | Move an archive |
| F8 | Copy an archive |
| Ctrl+R | Rename an archive. |
| Ctrl+M | Mail an archive. |
| Ctrl+A | Add files to an archive. |
| Ctrl+D | Delete files from an archive. |
| Ctrl+E | Extract files from an archive. |
| Ctrl+V | View files in an archive. |
| Ctrl+Slash (/) | Select all items in the list box. |
| Ctrl+Backslash (\) | Cancel the selection of all items in the list box. |
| Ctrl+S | Run virus scanner. |
| Ctrl+T | Test archive. |
| Ctrl+K | Create a self-extracting archive. |
| Ctrl+C | Activate CheckOut feature. |
| Ctrl+I | Install files in an archive. |
| Direction key(s) | Move the cursor or scroll to other items in the list box. |
| Shift+direction keys | Select multiple items in list box. |
| Enter | Same as <u>Double Clicking</u> in the main window listbox. |
| Shift+F8 | Toggle "add mode" on and off. When add mode is on, the selection cursor blinks. In this mode you can use the Spacebar to select non consecutive items in the list box or to cancel the selections. Press Shift+F8 again to end add mode. Clicking the left mouse button cancels any selections. |

Ideas for Future Enhancements

Ideas for future enhancements include:

- Support for other archive file formats, including RAR, PAK and ZOO.
- Built-in ARJ and LZH file extraction.
- Support for UUENCODE and UUDECODE.
- Support for all ZIP, LZH, and ARJ options, including comments, volume labels, and authenticity verification (AV number support).
- Support for printing, using the appropriate application to print, depending on the file.
- User configurable toolbar.
- A command line interface for use from other Windows programs.

Additional suggestions from all users are welcome.

Hints and Tips

Here are some hints and tips you may find useful:

- Learn to use the Windows help system! All Windows programs use the same help system, so you will quickly make up for the time you spending learning it by being more productive in all your Windows applications. To get started select **How to Use Help** from the Help menu.
- Read the section [Brief Tutorial](#) if you have not yet done so.
- Use the File Manager instead of the Open dialog box to select archives you want to open. Unlike the standard Windows Open dialog box, the File Manager lets you sort archives by date and size. To open an archive from the File Manager either double click on the archive or use the [Drag and Drop Interface](#) to drop an archive from the File Manager onto WinZip.
- Use the [Drag and Drop Interface](#) to add files to archives. The main advantage to using the Drag and Drop interface over using the Add Dialog Box is that you can sort files by date and size in the File Manager, making it easier to find the files you want to add.
- If you usually use the same directories when opening, extracting, or adding files, specify those directories in the [Directories](#) dialog box. Choose **Save Settings Now** from the Options pull-down menu to save your changes.
- To change the default WinZip window size and position to the current window size and position, choose **Save Settings Now** from the Options pull-down menu.
- To switch to another program during an archive operation, click on the window for the other program, or bring up the Task Manager by double clicking over the desktop or pressing Ctrl+Esc. Note: you cannot use the WinZip system menu or minimize button while WinZip is executing a DOS command.
- To interrupt an archive operation click on the WinZip window. This will activate the Operation Interrupted dialog box.
- Click on the Status bar to display the Archive Information dialog box.
- Click on the header in the main window to sort the list of files. For example, click on the word "name" in the header to sort the list by name.
- WinZip determines what drive and directory to use for temporary disk files by checking the value of the WZTMP=, TMP=, TEMP=, and PKTMP= environment variables, respectively. If none of these environment variables is set, WinZip uses the root directory of your C: drive. You can override this default by specifying a value as the **Temp Directory** in the Directories dialog box. Choose **Save Settings Now** from the Options pull-down menu to save any changes.
- You can open archives with WinZip by double clicking in the Central Point Desktop 2.0 File Manager if you turn off the **Show Compression Files** entry in the CPS File Manager's Tree menu.

Related Topics:

[More Hints and Tips](#)

More Hints and Tips

- You can change the default WinZip icon as follows:
 1. Open the Program Manager group window for the group containing WinZip. Highlight the WinZip icon.
 2. Choose **Properties** from the File menu, press Alt+Enter, or press Alt while double clicking the icon. The Program Item Properties dialog box appears.
 3. Click on **Change Icon**.
 4. Double click on your preferred icon.
 5. Choose **OK**.
- You can use the right mouse button to select files in the main WinZip listbox without canceling previous selections. This is often easier than using the standard shift-click method. For more information on selecting multiple discontinuous files in the main WinZip list box, see the section titled Using Extended Selection List Boxes.
- If you have a large RAM disk, use it as a temp directory to significantly speed up many archive operations.
- You can move or copy files from one archive to another by opening multiple WinZip windows, one for each archive, and dragging files from one to the other. Note that you need to turn off the **Reuse WinZip Windows** entry in the Options pull-down menu to start multiple WinZip windows.
- You can start WinZip every time you start Windows by adding the WinZip icon to the Program Manager "Startup" group. Be sure to select the **Run Minimized** checkbox in the Program Manager Properties dialog box.

Acknowledgments

Many people have helped make WinZip what it is, by making suggestions, helping test, reporting bugs, etc., but particular thanks goes to the following individuals: Robert Allen, Tom Bloch, Ora Lee Dinkins, Kent Downs, Brian Hill, David Hofmann, Gregg Hommel, Oyvind Kaldestad, Kevin Kearney, John Navas, Sven Schreiber, Paul Seltzer, Barry Steinholtz, Edward Stumpf, Roy Tate, Michael Weber, and Larry Wilber.

Special thanks to Steve Queen for his feedback on the WinZip user interface.

The portion of WinZip that creates ZIP files is based on the work of the Info-Zip group and used with their permission. If you are interested, you can obtain the Info-Zip code from many sources, including: CompuServe, ibmpro forum; BIX: ibm.pc listings; Internet, <ftp.uu.net/pub/zip>. Typical filenames are ZIP19P.ZIP, where 19P represents the latest version. If you cannot obtain this file from other sources you can send a self-addressed-stamped envelope with a disk to the address in the WinZip "About" dialog box.

Thanks to Jean-loup Gailly for permission to use portions of his gzip source in WinZip. The original sources to gzip are available on Internet as prep.ai.mit.edu/pub/gnu/gzip-*.tar.

Version History

For information on changes in the Win32 version see the section titled [WinZip for Windows/NT](#).

Internet File Format Support In WinZip 5.6

The Internet is becoming more and more popular, and unlike CompuServe and most other online services, not all parts of the the Internet have standardized on the ZIP file format. Many Internet sites distribute files in "gzip" and Unix "compress" format (files ending in GZ or Z) and use the old TAR (Tape ARchive) format to group files.

WinZip 5.6 adds support for the TAR, gzip, and Unix compress formats. This means you can use WinZip to work with almost all compressed files downloaded from the Internet. WinZip 5.6 also lets you decompress files in the "Microsoft Compress" format (LZEXPAND) used on the Windows 3.x distribution disks and some other Microsoft product distribution disks. No external programs are needed for these file formats.

Some notes on the new Internet file format support:

- WinZip does not let you create files in these formats, but other features (Extract, View, CheckOut) all work.
- Unlike ZIP, TAR, LZH, ARJ, and ARC files Microsoft-compressed files and Z files (gzip/compress) contain only ONE file.
- Unlike ZIP, LZH, ARJ, and ARC files, TAR files are NEVER compressed.
- Since TAR files are often distributed in Z format (with extensions like .TAZ and .TGZ) WinZip treats Z files containing containing a TAR file as a special case: WinZip offers to decompress and open the TAR file.
- There is no reliable way to determine the uncompressed size of files in the gzip and compress format, so WinZip shows the size as a question mark.

Other Changes in WinZip 5.6:

- A new checkbox in the Configuration dialog box determines whether the right mouse button pops up a menu or selects listbox entries as in earlier versions.
- Conversion from long names to MS-DOS 8.3 filenames is smarter than in previous versions: a name like XXX.YYY.TXT is now converted to XXXYYY.TXT rather than being truncated to XXX.YYY.

The following changes were made in WinZip 5.5a

- Handle ZIP files with spurious data at the beginning. For example, ZIP files uploaded by Mac users in "MacBinary" mode instead of "Binary" mode include 128 bytes of unwanted data that make all pointers in the ZIP headers invalid. Earlier versions of WinZip would not process these ZIPs because they contain technically invalid header information.
- Added "Hints and Tips" to the Help pull-down menu
- Added combo-box with history list to View dialog box.
- Double clicking on a file in a ZIP acts even more like double clicking on a file in the File Manager. WinZip now uses the "ShellExecute" API instead of the "WinExec" API to run programs when possible. This will, for example, load a new file into an existing Microsoft Word window rather than starting a new instance of Word.
(This feature is not available in WinZip for Windows/NT.)
- Added WNCPAV to list of virus scanners.
- Large toolbar buttons have shadows around the images for a slightly better 3d effect and are now always used by default for new users.
- WinZip can now be used to compress files with cc:Mail. To use this feature change the compress= line in the [cc:Mail] section of the appropriate WMAIL.INI files to specify the full path

for WinZip followed by "-a %1 @%2". For example, if WinZip is installed in your c:\winzip directory, specify

```
compress=c:\winzip\winzip.exe -a %1 @%2
```

(This feature is not available in WinZip for Windows/NT.)

- WinZip "associations" are stored in the registration database in addition to the WIN.INI file.

The following changes were made in WinZip 5.5

- WinZip's unique **Install/Uninstall** feature makes it easy to install *and uninstall* software distributed in ZIP files. WinZip will run the installation program in an archive, give you a chance to try the program, and optionally offer to restore your system to its original state. The uninstall step can selectively remove files, icons, or program groups created by an install program, and can restore any altered INI files. You have complete control over the uninstall process, and no changes are made without approval.

Unless you keep every program you install from a ZIP file, the Install/Uninstall feature will almost certainly save you megabytes of disk space and lots of time. It can keep your system from getting bogged down by extra unneeded files and fonts installed by applications you decide to delete. Windows application installation programs typically copy components into various directories, copy VBX and DLL files into your Windows directory, add entries to Windows initialization files, and create program groups and icons. It is almost impossible to keep track of all these changes manually. Undoing these changes is time consuming and complicated, and it is easy to miss files. WinZip's Install/Uninstall feature handles this chore automatically with an easy to use point-and-click interface.

(The "Uninstall" part of this feature is not available in WinZip for Windows/NT.)

- The **Move/Copy/Rename/Delete** archive management facilities make it easy to keep your download directory clean: after trying the software in a ZIP you can move it to a floppy disk, move it to your upload directory, or delete it without leaving WinZip.
- The new **File Manager Extension** adds a WinZip pull-down menu entry to the Windows File Manager for quick access. You can optionally have the File Manager automatically start WinZip when the File Manager is started and close WinZip when the File Manager is closed, so WinZip is always available for drag and drop operations.
(This feature is not available in WinZip for Windows/NT.)
- With **"Smart DOC Handling"** turned on, plain text .DOC files are viewed with a text editor and .DOC files created by word processors with the appropriate word processor.
- The **Reuse WinZip Windows** option prevents your screen from being cluttered with multiple WinZip windows when you open multiple archives by double clicking in the File Manager. Instead of opening an additional WinZip window an existing WinZip window is reused to display the selected archive.
- **CheckOut** dialog box: icons are created for all files with associations if the "create icons for programs and documents only" checkbox is selected. Also, an extra warning dialog box is displayed before CheckOut deletes any existing files or program groups.
- **Extract** dialog box: added **Create Dir** button because so many people did not realize they could just type the name of a directory
- **Overwrite** dialog box: added file sizes and date/time stamps
- **Directories** dialog box: added **Temp Directory** edit field to specify where temporary files are created. This overrides the TEMP= DOS environment variable.
- **Select All/Deselect All** menu entries moved to the Actions menu
- Default parameters for SCAN.EXE do not include /a which is illegal with the new SCAN 2.0
- The WinZip installation procedure creates a "WinZip" group instead of adding a WinZip icon to the "Accessories" group. The "WinZip" group includes an "Uninstall WinZip" icon.

- The default **Action** in the **Add** and **Drop** dialog boxes is reset to "Add" when an archive is opened.
- The **Mail Archive** menu entry was officially added to the File menu (it was available as an undocumented feature in WinZip 5.0b). This menu entry exists only on systems with MAPI.DLL installed.
- No attempt is made to delete any directory if any of its files are in use or any files in the directory are open.
- File Manager Association Icons are displayed next to each file listed in the main WinZip window so you can easily tell whether a file is executable or has an association.
- If System Compatibility Corporation's "Outside In" file viewer is detected it will be used as your "Default Association" in the Program Locations dialog box.
- Added **Set Installation Defaults** to the Options pull-down menu to set options to original installation defaults
- Miscellaneous documentation improvements, including a revised "Brief Tutorial", the "Step by Step Examples", and separate help panels for New Archive, Open Archive, View Dialog Box, and Built-in Viewer.

[WinZip for Windows/NT](#)

Fixing ZIP Files

If an ZIP file is damaged it can sometimes be repaired with the PKZIPFIX command. Simply type
PKZIPFIX filename

at the DOS prompt, and PKZIPFIX will create the "fixed" file PKFIXED.ZIP. PKZIPFIX is part of the PKZIP package available from PKWARE. See the section titled [System Requirements](#) for availability.

Message WZ10

To create self-extracting archives, first create a standard ZIP, ARJ, or LZH file, then use the **Make .EXE File** menu entries in the Actions pull-down menu. While PKZIP, ARJ, and LHA let you create archives with an extension of .EXE, these .EXE files are not self-extracting archives, and attempting to run them can lock up your system.

Message WZ11

A required file was not found.

The file listed in the dialog box was not found in your path or the specified location. Also, WINZIP.HLP, WZ.DLL, WZ.COM, and WZ.PIF must both be in the same directory as WINZIP.EXE. The Installation section describes the complete installation procedure.

Message WZ13

This dialog box is displayed if WinZip was unable to open the specified archive, read the archive directory, or if a filename is invalid. It is possible that the file is not an archive or does not exist. Alternately, it is possible that the archive has been corrupted. Other reasons for this error include insufficient memory and disk errors while reading the archive.

If you are working with a ZIP file you can try running the PKZIPFIX program distributed with PKZIP to fix the archive.

Register WinZip

Please enter your name and registration number **exactly** as they appeared on the mailing label of your WinZip order or upgrade notification. If entered correctly, your name will appear in the About dialog box, and the registration reminder dialog box will no longer be displayed when you start WinZip. Please save this information for possible use with future upgrades, or in case you re-install WinZip.

Note: If your name is spelled incorrectly in the upgrade notification, please write to the address in the About dialog box with the correct spelling, and you will receive a new registration number.

Internal Error

This dialog box is displayed when an unexpected WinZip internal error occurs. Please contact the author with as much information about the error as possible. For a list of contact points, choose About from WinZip's Help pull-down menu.

Message WZ14

This dialog box is displayed when a required edit field is empty or no entries are selected in a list box. For example, it is displayed if you don't specify which file you want to open in the **Open Archive** dialog box. Specify the required information and try again.

File already exists

To view a file, WinZip normally extracts the file to disk, reads it, and erases the temporary disk file. WinZip determines which disk to extract to by checking the value of the WZTMP=, TMP=, TEMP=, and PKTMP= environment variables. To conserve space on the DOS command line, WinZip creates temporary files in the root directory of the specified drive. If none of these environment variables is set, WinZip extracts to the root directory of your C: drive.

The message *The disk file "filename" already exists. Should WinZip overwrite it so that the file in the ZIP can be viewed?* is issued if a file with the requested name already exists on disk. If you choose Yes, the existing disk file will be overwritten, and processing will continue. If you select No, WinZip will abort the view operation for this file.

Warning WZ16

This dialog box is displayed if WinZip cannot display the entire file you are viewing because it contains binary zeros. WinZip uses a standard multi-line edit field to display files, and these controls truncate text at the first binary zero.

Message WZ17

This dialog box is displayed if you try to open a ZIP with a directory too large for WinZip to handle. You will not be able to open the ZIP file with this version of WinZip.

Message WZ8

This dialog box is displayed if an external command (for example, PKZIP or PKUNZIP) is over 127 characters long (the longest command allowed under MS-DOS is 127 characters). The total command line length includes several components used internally by WinZip in addition to the external command. There are a couple ways to reduce the length of the command line:

- 1) Move WINZIP.EXE (and the related files) to a directory near the root directory (for example, a directory like C:\WINZIP is better than C:\WINDOWS\UTILITY\SHAREWAR\WINZIP).
- 2) Move the archive you are working with to a directory near the root directory.
- 3) Move PKZIP.EXE, PKUNZIP.EXE, LHA.EXE, SCAN.EXE, etc. to a directory specified by your PATH= environment variable and remove any directory names for these programs in the Configuration dialog box.
- 3) If you are adding, deleting, extracting, or viewing multiple files at one time, specify them via a list box rather than an edit field. This causes WinZip to create a PKZIP/PKUNZIP, LHA, or ARJ response file, which usually takes less room on the command line than multiple file names.

Selected Text Successfully Copied To Clipboard

This dialog is displayed to let you know the text selected in the View dialog box has been copied to the system clipboard. You can paste the text into another application (for example, Notepad) by choosing Paste from the application's Edit pull-down menu.

Message WZ18

This dialog box is displayed when WinZip could not create a required temporary file on the disk drive listed in the dialog box. Possible causes are that the disk drive is invalid, or that the root directory of the disk is full.

WinZip determines which disk to use for temporary files by checking the values of the WZTMP=, TMP=, TEMP=, and PKTMP= environment variables. To conserve space on the DOS command line, WinZip creates temporary files in the root directory of the specified drive. If none of these environment variables is set, WinZip creates temporary files on your C: drive.

Message WZ19

When working with *format* files the "*action*" operation requires the *program* external program. This program is not installed or improperly installed.

This message is issued when the external program "*program*" required for the "*action*" operation is either not installed, or is installed in a directory other than the one specified in the Program Locations dialog box. If the specified program is installed, select Program Locations from the WinZip Options pull-down menu and specify the correct path information. If you do not have a copy of the specified program, see the section titled Requirements for information on obtaining the program.

Message WZ20

The program required to perform the function you selected is either not installed, or is installed in a directory other than the one specified in the Program Locations dialog box. For a complete list of supported external programs and information on obtaining these programs see the section titled System Requirements. Also see the section titled Installing Optional External Programs.

Two examples of why this error can occur are:

- 1) To extract files from an ARC file, you need to have specified an ARC extraction program, and the ARC extraction program you specified must exist.
- 2) To extract files from password protected ZIPs, or to extract files from a ZIP that spans multiple floppy disks, you need to have installed PKUNZIP, since WinZip's built-in unzipping does not handle these advanced ZIP features.

Message WZ21

WinZip can't find one of the programs specified in the active dialog box. If you specified a directory (for example, you entered C:\UTILITY\PKZIP.EXE), then WinZip can't find the program in that directory. If you did not specify a directory (for example, you entered PKZIP.EXE) then WinZip can't find the program in any of the directories specified by your PATH= environment variable.

Note: if you update the PATH statement in your AUTOEXEC.BAT, the changes will not take effect until you reboot your machine.

Message WZ22

WinZip does not recognize the name of the specified program. For example, you will get this error if you specify UNZIP.EXE as the name for PKUNZIP.EXE. WinZip lets you specify the drive and directory containing the program, but prevents the use of unsupported file names to prevent unexpected errors.

Message WZ23

Your ARC extraction program returned a non-zero error level. Consult the documentation for your ARC extraction program for the meaning of the error, and/or use the View Last Output entry in the Options pull-down menu to check for error messages issued by the ARC extraction program.

Note: one likely cause for this error is using an old version of the ARC extraction program. See the section titled [System Requirements](#) for version information.

Delete Entire Archive

This dialog box is displayed to give you a chance to confirm that you really want to delete the entire archive. Select No to abort the operation or Yes to delete the archive.

CheckOut Delete

This dialog box is displayed before closing an archive to give you a chance to have WinZip delete the CheckOut directory and the Program Manager CheckOut group. Select **Yes** to delete these items and close the archive. Select **No** to leave the CheckOut group and directory intact and close the archive. Select **Cancel** to cancel the close operation.

Message WZ24

Since most new archives are created in ZIP or LZH format, and there is no single widely available program to manipulate ARC files, WinZip does not provide facilities to create or update ARC files. WinZip does support viewing, running, and extracting files in ARCs.

Message WZ25

This dialog box is displayed when WinZip cannot run a program. This can happen when a program specified as a Windows Association was deleted from your system or was moved to a different drive or directory. The following are the error codes Microsoft has documented:

| Value | Meaning |
|-------|--|
| 0 | Out of memory |
| 2 | File not found |
| 3 | Path not found |
| 4 | Too many files open |
| 5 | Attempt to dynamically link to a task |
| 6 | Library requires separate data segments for each task |
| 8 | Insufficient memory to start application |
| 10 | Incorrect Windows version |
| 11 | Invalid .EXE file (non-Windows .EXE or error in .EXE image) |
| 12 | OS/2 application |
| 13 | DOS 4.0 application |
| 14 | Unknown .EXE type |
| 15 | Attempt in protected (Standard or 386 Enhanced) mode to load an .EXE created for an earlier version of Windows |
| 16 | Attempt to load a second instance of an .EXE containing multiple, writeable data segments |
| 19 | Attempt was made to load a compressed executable file. The file must be decompressed before it can be loaded. |
| 20 | Dynamic-link library (DLL) file was invalid. One of the DLLs required to run this application was corrupt. |
| 21 | Application requires Microsoft Windows 32-bit extensions. |

Message WZ26

WinZip encountered an error trying to view a file. Possible errors include insufficient memory and I/O errors.

Message WZ27

An incomplete filename was entered. If either a drive or subdirectory is specified, then both must be specified. For example, the following two filenames are incomplete:

C:PKZIP.EXE

\UTILITY\PKZIP.EXE

In the first example, a drive is specified but no subdirectory is specified. This can cause unexpected errors if you change the current directory on the C: drive.

In the second example, a subdirectory is specified but no drive is specified. This can cause unexpected errors if you change the current drive.

Specify a filename like C:\UTILITY\PKZIP.EXE instead. Note that if the file is in a directory specified by your PATH= environment variable you do NOT need to enter a drive and directory.

Warning WZ28

You used the Drag and Drop Interface to drop multiple files onto a WinZip window or icon, and at least one of these files had an extension of ZIP, LZH, ARJ, or ARC. Press Yes to add these files to the open archive.

Warning WZ29

The original release of Norton Desktop for Windows 2.0 does not accept files dropped by WinZip 4.0. This means you can't drop files onto the NDW desktop, Desktop Item Icons on the NDW desktop, or NDW group windows. Future versions of NDW, including a possible update to NDW 2.0, will probably accept files dropped by WinZip. This dialog box is displayed as a warning that the drop operation may fail because WinZip doesn't know whether files it drops will be accepted by your version of NDW.

The first time you see this dialog box just press the OK button. The drop operation will continue, and the Extract dialog box will be activated. After the selected files are extracted, WinZip will attempt to drop the files on NDW. If NDW does not accept the files, look for an update to WinZip or NDW in the not too distant future. If NDW accepts the files, select the checkbox labeled "This version of NDW accepts files dropped by WinZip" the next time this dialog box is displayed to suppress display of the dialog box in the future.

Message WZ30

WinZip could not change to the specified directory, so it is closing the open archive. Possible causes for this error include removing the directory, or changing disks in the middle of a WinZip operation.

Message WZ31

A serious system error was encountered trying to run the specified DOS command. This problem is usually caused by a system configuration problem such as using a Windows 3.0 video driver on a Windows 3.1 system, or using buggy video drivers, including "beta test" video drivers.

If you encounter this error message and are not using a Microsoft supplied video driver, try installing the VGA driver distributed with Windows to determine if the problem is caused by a video driver. See the section titled [Determining Whether A Problem Is Caused By A Faulty Video Driver](#).

Message WZ32

WinZip cannot detect errors issued from NAV unless you have DOS version 4.0 or later. Either use a different virus scanner or leave the virus scanner edit field blank.

Overwrite?

The specified file already exists on disk. Choose **Yes** to overwrite the file or **Yes to All** to overwrite this file and avoid this prompt for all other files during this operation. Choose **No** to bypass this file and continue the extract operation or **Cancel** to abort the extract operation.

File has been changed

WinZip detected that you modified a file after viewing it. Choose **Yes** to add the modified file to the archive or **No** if you don't want to update the archive.

Warning WZ35

The original file included subdirectory information, but no subdirectory information was included when the file was added to the archive. Thus, both the original and the new file are included in the archive.

Delete Temporary File?

Choose **Yes** to delete the temporary file or **No** if you want to keep it. Note that the file resides in a "temporary" directory specified by your WZTMP=, TMP=, TEMP=, and PKTMP= environment variables, so you should probably move the file to a "permanent" directory if you really want to keep it.

Warning WZ37

WinZip detected that the Control Panel "Exclusive in Foreground" option is selected. This option prevents WinZip from running DOS programs like PKUNZIP in the background. For proper WinZip operation, you must turn off this option. Under Windows 3.1 you can do this as follows: first double click on the Control Panel icon, then double click on the "386 Enhanced" icon; next, click on the "Exclusive in Foreground" checkbox, and finally push the OK button.

Message WZ38

WinZip cannot accept dropped files while the Drop dialog box is active. Close the Drop dialog box before dropping more files on WinZip.

Message WZ39

WinZip requires ARJ 2.3 or later. The date of your ARJ.EXE is earlier than 1/19/91, the date on which ARJ 2.3 was released. Please obtain a newer version of ARJ. See the section titled System Requirements for information on obtaining the most recent version of ARJ.

Message WZ40

The ZIP cannot be opened. If this ZIP is part of a backup set, please insert the last disk of the backup set and try again. Both PKUNZIP and WinZip need the last disk of the backup set to read the end-of-central-directory record. You may subsequently be prompted to insert other disks from the backup set. This is normal PKUNZIP operation and is not specific to WinZip.

If this ZIP is not part of a backup set it may be corrupted. You can try running the PKZIPFIX program distributed with PKZIP to "fix" the archive.

Message WZ41

This ZIP contains files compressed with PKZIP 2.0. However, **your version of PKUNZIP appears to be older than version 2.0, so the unzip operation will probably fail.** See the section titled System Requirements for information on obtaining the most recent version of PKUNZIP. See the section titled Built-in ZIP Extraction for a list of reasons WinZip's built-in ZIP extraction is not used.

Message WZ42

The Central Directory for this ZIP spans disks. This version of WinZip does not handle this situation, so you will have to run PKUNZIP from the DOS command line. Future versions of WinZip will address this issue.

Message WZ43

PKZIP 2.04C cannot create archives on your A: drive if your current drive is A: unless the PKTMP environment variable is set. There are two solutions to this problem:

- 1) Add the command SET PKTMP=C:\ to your AUTOEXEC.BAT and reboot.
- 2) Use a later version of PKZIP. This bug has been corrected in both PKZIP 2.04E and PKZIP 2.04G.

Message WZ44

An invalid CheckOut directory was specified. You cannot specify a root directory (e.g. C:\), and you must specify a drive letter (e.g. C:\CHECKOUT, not just CHECKOUT). The CheckOut directory cannot be the directory containing the open archive, since all files in the CheckOut directory are deleted at the beginning of the CheckOut operation.

Create Associations

Create File Manager Associations for ZIP, LZH, ARJ, and ARC files?

Answer Yes to this prompt if you want WinZip to create File Manager Associations so that you can start WinZip by double clicking on these files. If you answer No the installation will continue but you will need to open archives using the **Open Archive** dialog box or the Drag and Drop interface.

Warning WZ46

PKZIP disk spanning will replace all files in archive. Continue?

If you choose to continue all files in the archive will be replaced. PKZIP's disk spanning feature **always** replaces all files in the archive. PKZIP does not provide an option to avoid this behavior.

Message WZ47

WinZip could not create the specified directory. Possible causes are:

- A file exists with the same names as the directory
- Disk is read-only
- Subdirectories preceding the final subdirectory do not exist. For example, to create the directory "C:\UTILITY\FILES" the directory "C:\UTILITY" must exist.

Solution: specify a different directory name.

Message WZ48

Due to a limitation in the Windows Program Manager, it is impossible to remove a Program Manager group while closing Windows. Thus, if you want to remove Program Manager groups created by WinZip, you need to close WinZip before closing Windows.

Message WZ49

PKZIP does not allow the use of the Freshen and Update options while working with archives that span multiple disks. You have two choices:

- 1) Change the Multiple Disk Spanning option to "No Spanning".
- 2) Use the Add or Move actions instead of Freshen and Update.

Message WZ50

An error occurred opening, writing to, closing, or deleting the specified file. Possible causes include a misspelled filename, a full disk, a read-only or locked disk, or a read-only or locked file. The operation in progress will be aborted. Another dialog box with more specific information may be displayed.

This message may also be displayed because of an invalid archive. For example, if an archive is damaged (possibly due to line noise while downloading from a BBS) it may contain invalid pointers or corrupted header information.

Message WZ51

The open archive no longer exists on disk. It was probably deleted by another task.

Message WZ52

Nothing To Do: No files were found for the specified action. Examples of when this messages is issued include attempts to add a non-existent directory to an archive and attempts to freshen an archive that is already up to date.

Message WZ53

An invalid archive operation was initiated. For example, an attempt to add the same file from two different directories can cause this error. Check the warning messages for additional details about the problem.

Message WZ54

This error occurred during internal ZIP processing. Correct the error and retry the operation. If you have PKZIP/PKUNZIP installed on your system you can turn off the "Use Internal ZIP and UNZIP" checkbox in the Configuration dialog box to force WinZip to use PKZIP/PKUNZIP instead of the internal ZIP processing.

Message WZ55

WinZip could not access the correct version of WZ.DLL. It is possible that the WZ.DLL from a previous version of WinZip is still loaded, or that the wrong version of WZ.DLL is in the WinZip directory. To solve this problem follow both of these steps:

- 1) Verify that the WZ.DLL in your WinZip directory has the same date as WINZIP.EXE. If not, reload all WinZip related files from the distribution disk. DO NOT use WinZip to extract files from WINZIP.ZIP to the directory from which you are running WinZip, since that can cause unpredictable results.
- 2) Exit Windows and then run WinZip again. Closing Windows ensures that old versions of WZ.DLL are not loaded.

Message WZ57

There is insufficient free memory (RAM) on your system. Close one or more other applications and retry the operation.

Warning WZ58

One or more warning messages were issued by the internal zip procedures. Press the Yes button to view all messages issued while processing the last action, including informational and warning messages.

Virus Scan Complete.

This message is issued when a Windows-based virus scanning operation completes. If no error or warning dialog boxes were displayed by the virus scanner, then this dialog box indicates that no viruses were found. The Norton Anti-Virus scanner, the Central Point Anti Virus program, and any other properly configured virus scanner will display error or warning dialog boxes if a virus is found.

Message WZ60

To use the NAVW virus scanner you need the version distributed with Norton Desktop 2.2 or later. This message is issued if your NAVW.EXE has a date/time stamp prior to January 3, 1993. Either use a different virus scanner or leave this field blank until a new version of NAVW is installed.

Message WZ61

The open archive does not contain any files that match the filespec you entered in the Extract dialog box.

Message WZ62

WinZip could not copy, delete, rename, or move the file. Possible causes include: the file is read-only, the file is open by another process, or the file has already been deleted by another process.

Message WZ64

WinZip uses the standard Windows "Common Dialog Boxes" as a basis for the Add dialog box. Due to a limit in the Common Dialog Boxes the total length of all selected files cannot exceed 2000 characters.

You have exceeded or may exceed this limit. You can circumvent this limit by using the Drag and Drop interface to add files instead of the Add dialog box, or by specifying wildcards in the **Add Files** field in the Add dialog box (for example, *.c).

Message WZ65

WinZip could not make the specified directory the current directory. Probable cause: invalid or non-existing directory name.

Message WZ66

The temporary directory must be a fully qualified path. You must specify both the drive and directory, for example, **C:\TEMP** or **C:\WINDOWS\TEMP**.

Operation Interrupted

The archive operation was interrupted because you pressed a key or clicked on the WinZip window during the archive operation. Press the **Continue** button to continue the operation or the **Abort** button to terminate the operation.

This message will be displayed if you try to minimize WinZip during an archive operation. To switch to other tasks you can click on another window or use the task list (press Ctrl+Esc).

File Is In Use

A file can be "in use" for one of two reasons:

- 1) The file is open by another process. For example, a document might be open by a word processing application.
- 2) The file is "in use" by Windows. Files that are "in use" are typically programs (.EXE files) or dynamic link libraries (.DLL files) being run by the system. For example, you will get this message if you attempt to overwrite C:\WINZIP\WINZIP.EXE while running C:\WINZIP\WINZIP.EXE. The solution is to extract to a different directory, for example, C:\WINZIP5 instead of C:\WINZIP.

WinZip will not let you overwrite or delete a file that is "in use" by the system because this operation could cause unpredictable results, including system crashes. Windows may read from files that are "in use" at any time, and does not expect these files to change. If the file has been overwritten Windows will not know the data has changed and can become confused.

If this message is issued during an Extract operation you can either extract the file to a different directory, or retry the operation after closing the program that is using the file.

If this message is issued while WinZip is trying to delete a directory or file you can either continue without deleting the directory or file (and delete it manually later on) or close the file in question and re-try the operation.

Message WZ67

Cannot create *filename*. File already exists. Open existing file?

This message is issued when you press the **New** button on the toolbar or select **New** from the **File** menu to *create* an archive but the specified archive already exists. Since the file already exists it cannot be created. Press the **Yes** button to open the existing file or the **No** button to abort the operation.

Normally you should press the **Open** button to open an existing archive.

Message WZ68

Cannot open *filename*. File does not exist. Create new file?

This message is issued in one of two situations:

1. You pressed the **Open** button on the toolbar or selected **Open** from the File menu and specified the name of a file that does not exist.
2. You selected a filename from the File menu history list, but that file no longer exists.

Since the file does not exist it cannot be opened. Press the **Yes** button to create a file with the specified name or the **No** button to abort the operation.

Normally you should press the **New** button to create an archive.

Message WZ69

Due to Windows limitations it is not possible to run two *different* versions of the same program with the same name at the same time. As a result, you cannot use WinZip's Install/Uninstall feature to install WinZip.

Message WZ70

This dialog box is displayed when Windows returns a "File Not Found" error when WinZip tries to run another program. Possible causes include:

1. A program specified as a Windows Association was deleted from your system or was moved to a different drive or directory.
2. A required DLL or other component is not installed (e.g. VBRUN300.DLL).

Message WZ71

WinZip could not create a directory because a file (**not another directory**) with the same name exists. For example, if a file named "foo" exists you cannot create a subdirectory called "foo" in the same directory. Choose a different name for the directory you are trying to create, or delete the file with with the conflicting name.

Message WZ72

For seamless integration with WinZip your virus scanner must support automatic scanning. At the time this version of WinZip was released two scanners were known not to support automatic scanning: WSCAN 2.1 from McAfee Associates and MWAV (distributed with MS-DOS 6.x). Click Yes to continue if you are sure your scanner supports automatic scanning, otherwise press No and select a different scanner.

Message WZ73

WinZip was unable to make the directory displayed in the Add dialog the current directory. In some operating environments this can be caused by using UNC names. Another possible cause for this problem is a conflict with a "common dialog box" enhancement utility.

Caution

The **Caution** dialog box lists items that cannot safely be uninstalled but were changed during the install process. These items are unlikely to interfere with a successful uninstall. For example, a setup program might replace your existing copy of a common dynamic link library like CTL3D.DLL with the latest version of the same library. In normal situations your existing applications should work with the latest version of the library, so leaving this new version installed will not cause problems.

WZ74

(Win32 only)

This archive contains files with long filenames or blanks. However, you are using an external archive utility (e.g. PKUNZIP or ZIP2EXE), and external archive utilities don't support long filenames. Thus some (or all) operations involving this ZIP will fail. For example, if the archive contains the file "A LONG NAME" and you try to extract it using PKUNZIP or ZIP2EXE the file will be called "A LONG N".

WZ75

The archive does not contain complete filename information, so WinZip cannot determine the full filename of the compressed file. Replace all or some of the suggested filename with the corrected name and press OK.

WZ76

This compressed file contains a TAR file. Normally you will want to have WinZip automatically decompress and open the TAR file. If you choose **Yes** WinZip will

- Decompress the TAR file into your temporary directory (as specified in the Options/Directories dialog box).
- Open the TAR file in the temporary directory.
- Later, when you close the TAR file in the temporary directory, WinZip will automatically delete it.

Note that the original compressed file is not changed by this operation.

WZ77

This compressed file is stored in the "KWAJ" format introduced after Windows 3.1. Your copy of the LZEXPAND.DLL or LZ32.DLL cannot handle this compressed file. The version of LZEXPAND.DLL distributed with Windows for Workgroups 3.11 works fine, while the old one distributed with Windows 3.1 will not work. Unfortunately, the LZ32.DLL distributed with initial release of Windows/NT 3.5 will not handle these files. Microsoft is aware of this limitation.

WZ78

The file you tried to open does not appear to be in the Microsoft Compress (LZEXPAND) format. Note that not all files ending with an underscore are in the Microsoft Compress format. For example, some files in the "BBS distribution" version of WinZip have names ending with an underscore but are not in the Microsoft compress format.

WinZip for Windows/NT

WinZip for Windows/NT is a full Win32 version of WinZip with long filename and UNC support. With a few exceptions this version is functionally equivalent to the 16 bit version, but because it is a native Win32 application it multi-tasks better and is faster than the 16 bit version (in particular unzip operations are noticeably faster).

WinZip for Windows/NT has been tested under Windows/NT 3.5. No problems have been reported under the current (October 94) beta test version of Windows 95, but the program has not been tested under the "release" version of Windows 95.

The following features are not implemented in WinZip for Windows/NT:

- The "Uninstall" portion of the "Install/Uninstall" feature

- The File Manager Extension

- The "-a" command line option new in the 16-bit WinZip 5.5a

Requirements:

You **must** have a Win32 system at the Windows/NT 3.5 level or later installed to use this version of WinZip.

Notes:

- The best way to add files with long names to ZIP files is with the drag and drop interface. The Add dialog box has a few limitations, discussed below.
- The current versions of all optional external archivers used by WinZip are DOS programs and do not support long filenames. Therefore, WinZip will pass the short 8.3 version of all long file and directory names to these external programs. Since normal 8.3 names are usually more meaningful than the shortened versions of long filenames, it is recommended you use standard 8.3 filenames when working with external archivers.
- Long Name Caution: DOS and 16-bit Windows programs usually have trouble with long filenames and files with spaces in the name. Therefore, it is recommended that you do *not* use long filenames and files with spaces in the name if you plan to work with these files from DOS. For example, PKUNZIP 2.04g will extract the file "A Long Filename" as "A LONG F", ignoring the extra characters. To avoid this problem check the **Store Filenames in 8.3 Format** checkbox in the Drop dialog box when adding files.
- There are some anomalies in how the Add dialog box handles long filenames and files with blanks. Note that the Add dialog box is based on the standard Windows "multi-select" open dialog box, so this behavior is common to all applications that use this common dialog box. The dialog box shows the short form of long NTFS filenames with blanks, but does not list 8.3 files with blanks (e.g. the filename "nico mak computing.txt" is listed as "nicoma~1.txt" while the filename "nico mak.txt" is not shown at all). HPFS filenames with blanks are never shown.
- Some of the 16-bit Windows virus scanners listed in the Program Location dialog box do not work or are not available under Windows/NT.
