

Welcome To Ashmounts Products

There are a variety of ashmounts Off Line Readers and conferencing products available for installation. the single user versions for cis or cix, the multi version which is for cix and cis and then powwow which adds multiuser access to the messagebase and local conferencing and email.

There is also a directory of additional tools to install to enhance your version of WigWam/PowWow.

The files in this directory

Install.exe this is the thing that runs others, it will kick off the install of which ever version of wigwam or powwow you want. You could alternatively run the setup.exe program contained within the various subdirectories to install that version.

vbrun300.dll the visual basic runtime, needed for install.exe

cis.exe this is a replacement comms module for communicating to compuserve, som people find that it gives better performance than the one installed by default. If you do experience problems communicating to compuserve then try replacing the one in the main wigwam/powwow directory with this one.

cix.exe this is a replacement comms module for communicating to cix, som people find that it gives better performance than the one installed by default. If you do experience problems communicating to CIX then try replacing the one in the main wigwam/powwow directory with this one.

ctl3d.dll this is the 3d effects library - you almost certainly have this one installed in your windows system directory already. Compare the dates of the two files - if this one is dated later than the one in your windows system directory then copy this one over it.

commdlg.dll this is the common effects library from windows 3.11- you almost certainly have this one (or the one from 3.1) installed in your windows system directory already.

readme.wri - it's me!

Rregards,
