To run a mdl file , make a subdirectory in your Quake directory (you can call it anything, just not longer than 8 charectors) then make a subdirectory in that directory called Progs. Than put the mdl files in it and run Quake like this

                                    Quake -game dirname

were dirname is the name of the first subdirectory .
