

ADD-ON

ADD-ON manager for View Mailer
January 28, 1991

ADD-ON is a program designed to allow future updates to the view mailer, without increasing the size of VIEW. With the ADD-ON manager, up to 10 external programs can be defined. Once a program has been defined, you can activate that program from within the VIEW mailer.

You can execute ADD-ON from within View mailer, or as a stand-alone application in Dos. ALT-A will bring up the add-on manager from within View. ADD-ON.EXE must be in the \SPOOL directory if you want to have it as a View window. If you are running ADD-ON from dos, there are some command line paramters available:

/B force black&white mode (default)
/C force color mode
/A run as an add-on application (windowed in application)

Example from DOS for color system:

```
C> ADD-ON /c
```

When you specify an add-on, you must give the full dos path and filename. Command line paramters can be specified also. Any key can be bound to an application. For example, you could define 'T' to run your favourite terminal program.

Other ADD-ON utilities include a Queue Manager, and a phone book manager for aliases/nicknames.
