

### **Information Required by Setup**

When installing Microsoft Index Server, the Setup program will ask you in which directories to put:

- Sample scripts.  
This directory will be referenced by the virtual root /Scripts
- Sample HyperText Markup Language (HTML) pages.  
This directory will be referenced by the virtual root /
- Default index.  
A directory named Catalog.wci will be created at this location. Index size can be up to 30% of the size of the original input text, so pick a location with enough free space.

**Note** By default, Setup puts sample scripts into /Scripts/Samples/Search and sample HTML pages into /Samples/Search.

### **Additions to Your System**

In addition to copying sample files and the default index to your computer, Setup also does the following:

- Copies dynamic link library files (DLLs) to the \Winroot\System32 directory.
- Add keys to the registry.
- Installs performance counters.
- Creates the Srchadm folder for the administration page and administration sample pages.
- Creates, by default, the Help folder under the Srchadm folder for the Index Server documentation.
