System 7.5 Update 2.0 Revision 2

This update is only meant for certain Macs. Please read the [read me](#) text available at Apple's FTP Sites.

System 7.5.5 Update

This was just released in September. I have added the [read me](#) for additional information on the update.

Apple is delivering its final system software release for the Macintosh Plus, SE, Classic, Portable, PowerBook 100, SE FDHD, SE/30, LC, II, IIx, and IIcx.

These computers were not designed to support 32-bit memory addressing.

Future Mac OS releases will require 32-bit memory addressing, which is

supported by all other Macintosh models.

Apple Laserwriter Driver

Laserwriter 7.2 (Note 3)

Laserwriter 8.2f (Note 4)

Apple CD-ROM Drivers

Notes:

1. This will change the version number to 7.0•
2. This will change the version number to 7.5.1
3. It may be recommended that both versions of the Laserwriter software be installed. Some programs do not work with version 8.2.2 and 8.3 and you may print faster with version 7.2.
4. This version of the Laserwriter software is meant for those users that own Apple printers with internal FAX boards.
5. This update will update all Macintosh computers to System 7.5.3 and will also install Open Transport 1.1.
6. This updater corrects problems with the Apple Vision Displays after installation of the 7.5.3 update.

This is not meant to be a list by which everyone should configure their computers. It is only meant to be a quick reference list of the latest versions of major software releases from Apple and which computers they should be used on.
