Simulation view

Changes the view mode of the active folder to "Simulation view". Just like in "Node table view" the node data is displayed in a table. Above the table, however, there are some special fields for setting up a simulation. These include goal node, seed settings, number of iterations in the main and criticality simulation.

Although you can run a simulation from any type of view, most often you would choose to run it with the active folder in "Simulation view" mode.
