Contingency…

Displays a dialog box where you can change the contingency settings for the active simulation data file.

The contingency settings are used e.g., as a basis for calculating project reserves. The contingency settings, possibly together with the fractile set, reflects your risk management policy.

If you change the contingency settings, these new settings are used until you close the file, or change the settings again.

Note that you can change the default contingency settings by using the "Data file options…" command of the "Preferences" submenu in the "File menu".
