MS Project events

The MS Project events let you combine schedule risk in a DynRisk model with a MS Project schedule. You can send durations from DynRisk to a table in MS Project. However, it is not possible to send data from MS Project (version 3.0) to DynRisk because of lack of flexibility in the MS Project macro command language. To get data from MS Project back to DynRisk, you can send data from MS Project to Excel using DDE links, and retrieve the data from Excel using Excel event nodes in DynRisk.
