

Trash

When you move model objects to the Trash, these objects are not deleted immediately. As long as you do not empty the Trash, you still have the chance to rescue them by moving them back to a suitable folder. However, when you empty the Trash, then all objects in the Trash are lost forever. To prevent accidental loss of data, DynRisk can warn you before emptying the Trash. This will happen if you leave the “Warn before emptying” checkbox checked. If you want to take full responsibility for Trash management yourself, and avoid these warnings, leave the “Warn before emptying” checkbox unchecked.

Note that when you save a model file, DynRisk will empty the Trash. If you have chosen to skip trash warnings, this too will happen without any warnings.
