

SysInfo Component: Overview

The SysInfo component adds information about available system resources (memory and disk space) to your **About** dialog box. Your project must be generated by the MFC AppWizard.

SysInfo Component: Specifics

The SysInfo component uses the existing **CAboutDlg** class. The **CAboutDlg** class is generated by the AppWizard and is normally in the *project_name*.CPP file.

For more information, see the WordPad sample, which is an MFC Ole Sample.

SysInfo Component: Results

This component adds three new member variables that hold system information. To finish adding this information to your **About Box**, see the “TODO” comments in **CAboutDlg::OnInitDialog()**.
