

QuickTime VR Movie Controller

In general, the mouse is used to navigate QuickTime VR movies. However, the movie controller offers more options. The QuickTime VR movie controller is shown below.

- It controls some aspects of a QuickTime VR movie.
 - The first icon (far left) goes back to the last-visited scene in a multiple-scene QuickTime VR movie.
 - The next icon 'zooms out' of the movie, so that more of the movie is visible.
 - The next icon 'zooms into' the movie, so that details can be seen more clearly.
 - The next icon shows all visible 'hot spots'. These are locations in a QuickTime VR movie which, when clicked, perform some action.
 - The next icon allows you to drag objects if they are 'zoomed in' and therefore do not show the entire movie.
 - The long empty bar in the centre is the help box and shows brief descriptions of the controller buttons when the mouse moves over them.
 - The last icon (far right) is the size box
 - the size box resizes the movie window.

QuickTime VR Movie Controller Tips

- Moving
 - use the arrow keys to navigate a panorama or rotate an object.
- Zooming
 - press control to zoom out,
 - press shift to zoom in.
- Hot spots
 - press option to show hot spots.
- Size Box
 - press option while dragging the size box to size the movie in or out at regular intervals
 - i.e. double, normal, half, third and quarter sizes,
 - press shift to maintain the length-to-width aspect ratio.
