Please access this help file direct from the program

CGM Open options

- ⊡ **Force Vector Fonts** controls the way fonts are converted (this option often has no visible effect)
- ⊡ **Ignore Background** controls the way any background in the original is converted
- ⬍ **Dot Lines** defines how styled lines are converted
- ⊡ **Default Color Table** assigns the Harvard Graphics default 256-Color table to the opened image

DXF Open options

- ◉ **Image** controls if the graphic's original colors should be retained or converted to black on white
- ◉ **Background** controls the color of the background (paper) when converted
- ◉ **Text Font** controls the way fonts are converted (this option often have no visible effect)
- ◆ **Palette** specifies how many colors the original graphic contains

---

PIC Open options

- **Pen** determines how elements in a PIC chart or graph are converted
- **Image** specifies the size of the image after conversion
- **Default** resets values to their defaults

Photo CD Open options

- **Resolution** allows you to select the size and resolution of the image to be read.
- **Data Type** determines the data type of the image to be read

Open options

The Options button displays the open options dialog box for images and graphics file of particular file formats. This dialog box allows you to define the way the images are opened. This button is only available for some file formats and the dialog box that appears depends on the selected file format.

- **Computer Graphics Metafile (CGM)**
- **ASCII AutoCAD (DXF)**
- **Kodak PhotoCD (PCD)**
- **Lotus Picture Format (PIC)**

Save options

The Options button displays the save options dialog box for a chosen file format. This dialog box allows you to define the way files are saved in the chosen format. This button is only available for some file formats and the dialog box which appears depends on the selected file format.

[db]	**Windows Bitmap (BMP)**
[db]	**Encapsulated PostScript (EPS)**
[db]	**IFF File Format (IFF)**
[db]	**JPEG file interchange format (JPEG)**
[db]	**Photoshop File Format (PSD)**
[db]	**Sun Raster (RAS)**
[db]	**Targa (TGA)**
[db]	**Tagged Image File (TIF)**

BMP Save options

Bitmap Type determines if the BMP file is saved in Windows or OS/2 format

IFF Save options

Compression gives you the choice of saving with or without RLE compression

TIFF Save options

Format should be chosen based on whether the image is going to be transferred to an Apple Macintosh or to be used on IBM-compatible PC's

Compression displays the compression options available for saving images of the current data type in this format

Strip Size determines the size of the contiguous strips your images are divided into for saving

Tile Size determines the size of the squares your images are divided into for saving

Use Horizontal Differentiation allows you to further increase the amount of compression

Preview TIFF allows you to choose to include a small version of the image for display purpose

RAS Save options

Compression gives you the choice of saving without compression or with RLE compression

Byte Order determines if Most Significant Byte (MSB) or Least Significant Byte (LSB) is placed first

Color Order determines the order colors are encoded: blue, red, then green (BGR), or red, green, and then blue (RGB)

TGA Save options

Compression gives you the choice of saving with or without RLE compression

JPEG Save Options

Compression Level determines how much an image is compressed

Subsampling allows you to improve the compression ratio for RGB True Color images

Save Preview saves a thumbnail preview of the image for display purpose (for example, automatically activates the Preview button in Open dialog box)

_____

EPS Save Options

Format determines how the EPS file is saved

Preview TIFF allows you to choose to include a small version of the image for display purpose

---

PSD Save Options

 Compression gives you the choice of saving with or without RLE compression

This option causes styled lines to be converted to thin dotted lines. If this option is not selected, styled lines are converted to thick solid lines.

Set this option correctly or else some of the colors (from 8 to 15 in the color table) will be read incorrectly.

You can choose to break your image into 256 x 32, 128 x 32, 128 x 64 or 64 x 64 squares. The bigger the size of the squares, the stronger the compression.

This option has little effect on uncompressed files, so we suggest you use the default of 8 for these. For compressed files, the larger the strip size, the greater the amount of compression possible. Some applications will not read TIFF files which are saved with large strip sizes. For these applications use 4K strip sizes.

The effect of this routine depends on the nature of your image. For some images (containing random changes in color and many stray pixels) it will have little or no effect, for others (with large areas of continuous color) it will improve the compression considerably.

This option has no direct relationship with the actual compression ratio achieved, but generally, the higher the level, the greater the amount of compression.

This option is unavailable for Grayscale images.

ASCII is the basic format that can be read by all EPS-compatible software. Binary may not be compatible with other software, but files saved in Binary format will occupy about half as much disk space as those saved in ASCII format.
