1.2 Introduction

Introduction

When you've had an Amiga for a while, and you've installed software all over the place, despite your best efforts, you finish up with AmigaGuide documents and ReadMe files scattered across your hard drive(s). Now this is fine, until you come to want a specific guide, or aren't sure exactly which guide you are looking for. Wouldn't it be nice to have all your AmigaGuides and ReadMe's available

from a single hotkey, and to be able to search for keywords throughout them all. ←
That's where GHelp
comes in.

Quite simply, GHelp consists of three programs that work together as a package.

GHelpGen searches your hard drives (the exact search paths are configurable) and ←
creates an index
which is used by GHelpGUI

GHelp is a small commodity that sits in the background waiting for you to press ←
your (user definable)
hotkey combination.

I know that there are other programs available on AmiNet to do something similar, ←
but those that I've
tried either don't work, or, they don't provide the complete solution that GHelp ←
does.

All I can say is, Try it. If you like it, tell your friends and
me
, if you don't, tell
me
.

If you can see a way to improve it, tell
me
, but see the
To Do
section first to get an idea of where I
am going with this.

Steve Hargreaves.

1.3 Distribution

Distribution

GHelp is TreatMe ware

This package may be distributed via whatever means you want, provided
the archive remains intact and none of the files in it are modified.

If you like it, please treat me, either send me something that you have done, or ←
a keyfile for your
(own) registered work, or even just an acknowledgement. If you want to make a ←
more fiscal
contribution then email me and I'll let you know how :o)

Disclaimer

By using this product, you accept the full responsibility for any damage
or loss that might occur through its use. The author cannot be held responsible ←
.

1.4 System Requirements

System Requirements

An Amiga

AmigaDOS sort and list commands in your C: directory (for GenGuide)

A few Amigaguide documents

Not essential, but a hard drive - it isn't really very useful without

An AmigaGuide viewer (Multiview is the default)

1.5 Features

Features

- It's a commodity
- Configurable through tooltypes if run from Workbench, or from the commandline
- Clean GadTools interface
- Allows progressive searching for keywords
- Let's you delete files (useful if, like me, you find you have more than one copy ↔
of the same
AmigaGuide file
- Very small commodity
- Free
- It works (or at least, it does here)

1.6 Limitations

Limitations

None at the moment (compared with what I set out to achieve). If you spot any, ↔
please let me know.

1.7 To Do and New

To Do

- Make the GUI font adaptive (maybe). Your workbench prefs system font will be ↔
used. If there is a
problem opening the prefs, Xen.font size 8 is searched for and used.
- Multiple indexes, allowing GHelp to be used as a Global file viewer (when used ↔
with a utility
such as IDer as the default viewer)..
- Dunno, suggestions?

New in Deluxe Version

Where do I start:-

- Completely re-written from scratch
-

- GUI instead of an AmigaGuide index
- Search guides facility added
- Dispensed with the ARexx requirement
- The whole package is integrated to work together
- Much more modular
- Simple to use

1.8 Installation

Installation

Copy GHelpGen to C:
Copy GHelpGUI to C:
Copy GHelp wherever you want (I suggest WBStartup)

If you are upgrading from GHelp, delete the file GuideGen from C:. You don't need it anymore. GHelpGen has taken over it's job. ↔

1.9 Configuration

GHelp can be run from CLI or Workbench. The CommandLine template is as follow:-

GHelp VIEWER=path/file HOTKEY=hotkey

VIEWER - The path and filename of your preferred AmigaGuide viewer. Defaults to Sys:Utilities/Multiview if not provided.

HOTKEY - The hotkey combination to activate the guide. Default is "LALT HELP"

Configuration can also be made through tooltypes. The tooltypes supported are as in the commandline. ↔

1.10 Usage

Usage

Well, once it's running, just press the hotkey combination, and away you go.

The GHelpGUI will appear on screen. See GHelpGuide.iff" for a preview.

The interface operates as follows:-

The lister - lists all available AmigaGuides, or the results of your most recent search. ↔

The string gadget below the lister shows you which is the currently selected guide. ↔

Buttons:-

"Open" - will open the selected Guide
 "Search" - Opens the search requester
 "All" - Re-displays the complete list of available guides
 "Generate Index" - (re)generates the index used by GHelp. Note, use this wisely. ←
 If you have a
 large hard drive, it can take a while, and you can't quit it. See below for ←
 usage.
 "Delete" - Deletes the selected guide. Confirmation is required.
 "Done" - Closes the GUI

"Generate Index"

The boxed section below the "Delete" button controls how the index is generated.

The three checkboxes ("Guide Files", "ReadMe files" and "Doc files") provide a ←
 quick way to include
 files of these types. Files are recognised by their suffix.

The string gadget "Other Filters" allows you to include additional files. This is ←
 in standard AmigaDOS
 format, supporting wildcards (#?). Separate multiple entries with a "|" character.

Paths determines where GHelp will search for files. To include everything, use " ←
 DH0: DH1:" etc. Each
 path should be separated by a space. Non-existent paths will be ignored. Sub- ←
 directories are searched
 automatically. You can search a specific directory by entering the full path.

Please note that Generating the index can take a while, and cannot be aborted. Be ←
 aware of this
 before you click on the button. Once you do, there's no going back.

NB. The old index is overwritten by this process.

NB. The index is stored in your HELP: assign. Please ensure that you have an ←
 assign to this on your
 system.

Searching:-

When you select search, you will be given a requester to type your keyword. This ←
 MUST be between 3 and
 32 characters, and must match (part of) the word that you are searching for. ←
 Wildcards are not
 supported, but you can progressively narrow down your search by initiating searches ←
 one after the other.
 Only Guides currently shown in the Guide List are searched.

eg. Suppose that you wanted to search for a document giving details of how to ←
 print from Turboprint
 using Ghostscript. You could search first for "print". All documents containing ←
 the word print will be
 listed. You would then search for "Turboprint". Documents found by the first ←
 search will be searched,
 and the Guide List updated accordingly. Finally, searching for "Ghostscript" will ←
 limit the Guide List
 to only those Guides containing all three words.

this is only a quick (and rather convoluted) example. I'm sure there are faster ways to find the above. Experience and knowing what is on your own hard drive will enable you to choose the best keywords.

If you want to search all guides again for another keyword, click the "All" button before searching.

During the search, a window indicating progress will be displayed. You can abort the search (after the current document) from here.

GHelp can be controlled through Exchange.

Useful Feature

Because GHelpGen allows you to specify your own search patterns, it is also possible to use it create an index of other files. eg. Images. Simply include the required patterns "Other filter" box. If you use Multiview, you will be able to view the files provided you have the appropriate datatypes just by clicking on the links.

This is a handy side effect of pattern matching. Because ALL matches to the pattern are shown, you can also use GuideGen to find duplicates of files across your system.

1.11 Contacting the Author

Contact Info

```
EMail:  
}  
    Steve@hargreavess.freemove.co.uk
```

Other stuff by me

- Blitzdock - a dockbar utility
 - PlaceMouse - place your mouse wherever you want at startup
 - ScalosEject - an Eject popup menu item for supported drives usable for Scalos (See www.scalos.org)
 - AmigaDraughts - Draughts on the Amiga - one or two player.
 - CDEject - Similar to ScalosEject, but places an Eject Appicon on WB
 - WBCycle - pretty up WorkBench window borders.
-
