ADMail

1.1 ADMail - Amazing Developments Mail

Amazing Developments Mail 1.5
By Simon Brown

(c) 1995 Amazing Developments

Introduction~ ~~~
- what it's all about.

Installation
- how to install it.

Configuration~ ~~
- how to make it work the way you want.

Operation~ ~~~
- how to use it.

The menus
- controlling everything.

The alias list
- how to store your chums' addresses.

Command-line options
- even more versatility.

Things~to~do~ ~~~
- what it doesn't yet have.

Bugs~~~~~ ~~
- which bits don't work.

About~the~Author
- who to send the cash to.

Acknowledgements
- who I'd like to thank.

History - what changes have been made.

1.2 Introduction

Welcome to ADMail, the latest in fun and friendly programs from your friends here at Amazing Developments.

ADMail is a GadTools-based UUCP/SMTP electronic mail reader and poster, combining the ease of use of Intuition with the configurable cunningness of, er, something that's really configurable. And cunning.

My guess is, that if you've been able to download this archive, you'll know enough to be able to use the package...

ADMail is fully functional "out of the box" - I don't believe in crippled software, apart from the bits I haven't written the code for yet :)

Oh, and by the way - ADMail is SHAREWARE, as defined in section 4 of this standard FD-Copyright document, and worth a tenner of anybody's money if you ask me.

Therefore: if you use this program loads, you are required (and indeed, morally obliged) to send me a sum totalling no less than ten English pounds, taking into consideration all monetary conversion costs. You are welcome to send more if you wish...

For your tenner you will receive the splendiferous ADMaN, a combined mail/news package incorporating all of the features of ADMail, and which will probably not go on general release. This is what is known as "an incentive".

If you have an e-mail address (and it's pretty unlikely that you won't, let's face it) then send it along with the registration, and I'll e-mail ADMaN to you as soon as possible. Otherwise, you'll have to allow for postage and media costs.

1.3 Installation

Installation of ADMail is easy, but setting it up is a bit more ←
difficult. To

that end, the Installer script supplied will install ADMail for you, and will also enable you to set some of the configuration options. You'll need the standard CBM/AT Installer program, which is not supplied, to run the script.

If you've got this program, double-click on the Install icon. If not, copy the ADMail binary, script, and icon to where you want them to be, and modify the script to point at ADMail's location. Then go to the

Configuration
section.

Before installation, you'll need to check a couple of variables ADMail requires for correct operation. These can be located in the local or global environment, or in the "UULib:Config" or "S:UUConfig" files (if you have them).

The variables are:

USER Should contain your user ID (e.g. "simes").
REALNAME Should contain your real name (e.g. "Simon Brown").

and either

HOSTNAME Should contain your machine's full name
(e.g. "amdev.demon.co.uk")

or

NODENAME Should contain your machine name (e.g. "amdev")
DOMAINNAME Should contain the domain your machine is in (e.g.
".demon.co.uk")

It is assumed that these variables will be set up by whichever Internet software you're using.

ADMail should now be installed correctly in your system.

1.4 Configuration

ADMail is quite a complex piece of software. Because of this, there are a large number of configurable settings, to enable you to tailor it to your own system. ↔

The configuration system has been altered slightly - there may now be a base configuration file, stored as ENV:ADMail.config, which may contain all of the standard options. This file is read first, followed by the user's config file as detailed below. The main reason behind this method is so that the base directories may be set up using the base config file, which is stored in a directory guaranteed to be present on all systems. In addition, people having more than one user may choose to just use the base config file, rather than maintaining a number of identical files in different directories.

NOTE: The use of this file is NOT mandatory, and if you don't want to use it, or are happy with the way you have a previous version set up, then don't use it. ADMail will work perfectly happily without it.

The user configuration file is, by default, stored in the file ADMail.config in the \$BASEDIR/<user> directory, where <user> is either the value of the USER variable, or the value for USER specified on the command line. \$BASEDIR is the base directory (see below) and defaults to "USR:".

If the CONFIG command-line option is used, the file is read from USR:<user> as above. Subdirectories may be specified in the CONFIG value.

The config file is a standard text file, with one option per line. Each option is specified as follows:

```
Option      "Setting"
```

with the option first on the line, one or more spaces, and the setting. The setting should be in quotes for best effect, but it's not mandatory.

Config topics:

```

Dirs & files
  - where things go.

External programs
  - helper programs.

Strings
  - bits of text.

Switches
  - turn things on and off.

Window settings
  - put the windows where you want.

Variables
  - internal variables.
```

1.5 Configurable directories and filenames

These settings control where ADMail looks for the files it needs and what some of these may be called. All but one can use the \$BASEDIR and \$USER variables

```

BaseDir      The base directory. Any other directory strings may
              include this using the $BASEDIR variable as the root.
              Most of the default directory settings use this as the
              root. Most usefully set in the config file in ENV:.
              Default "USR:"

SaveDir      Default directory for saving messages. The directory in
              which the requester will open.
              Default "RAM:"

SigDir       Directory where your signature and .mailheaders files lurk.
              I suggest you use $USER somewhere in this.
              Default "$BASEDIR/$USER"

SigFile      Name of your signature file.
              Default ".signature"

MBoxDir      Directory in which your mailboxes lurk.
              Default "$BASEDIR/Mail"
```

If you wish, you can add custom headers to your mail messages. Create a

file named ".mailheaders" and put the headers you want into it. Put this file into the same directory as your signature file and ADMail will include it with every outgoing message.

1.6 External programs

These settings control which external programs ADMail uses to perform various tasks. Environment variables can be used in place of filenames, if required. Note: Don't use "run" or similar commands to try and speed up operations. It won't work, because ADMail will try and utilise the file before the program gets to it. Don't say I didn't warn you.

Sendmail	Command string to call your sendmail program. Default "sendmail <\$MSG -f \$USER"
UUDecode	Command string to call your UUDecoding program. The default uses Asher Feldman's excellent UUxT program, and the options will probably not work with any other UUDecoder. Default "UUxT x \$MSG dest=RAM:"
RandSigHook	Name of command to generate your random signature. If RandomSigs is set, this command will be called just before the editor is loaded. This command should create a new signature file, corresponding to the dir/name you have chosen. The \$GROUP variable may be used here. Default "MakeSig"
Editor	Command string to call your editor. Default "\$Editor" (this is an environment variable)

1.7 Configurable bits of text

These settings cover all the other bits of text that get used in the program. Most of them are used when building replies to messages.

Salute	String placed at the start of replies. Default "Greetings, \$FIRSTNAME."
ForwardIntro	String placed at the start of forwarded messages. Default "On \$DATE, \$NAME wrote:"
IndentPrefix	String placed at the beginning of each included line in a reply. Default "> "
PubScreenName	If PubScreen is "Yes", this option gives the name of the public screen to open on. Default is to open on the default public screen.
MailButtons	Layout of the button bank. Each item should be named after the chosen function's menu item, and the items should be separated by the vertical bar character " ". Default: "Decode Delete Undelete Save Send new Reply Forward"

1.8 Toggles and rockers

These settings control the way sections of ADMail function, controlling the way in which various different functions operate.

ToReceived	Transferring new messages to the received file. The options are: "Ask" - Ask if the messages should be transferred. "Always" - Always transfer, without asking. "Never" - Do not ask or transfer. Default "Ask"
SortBy	How to sort mailbox entries. Note that the mailboxes will be saved in the sorted order. The options are: "Natural" - Do not perform a sort on the messages. "Name" - Sort by the name of the sender. "Subject" - Sort by the subject of the message. "Date" - Sort by the date the message was sent. Default "Natural"
UseUUConfig	Whether to search UULib:Config and S:UUConfig for environment values. Set this to "No" if you don't have these files. Default "Yes"
LogOutgoing	Whether to save outgoing mail into UUMAIL:<user>.sent. Default "Yes"
LogEncoded	Whether to store UUEncoded files in their entirety in the log file. Only valid if LogOutgoing is "Yes". Default "No"
IncludeFrom	Whether to include a From: header in the outgoing message. Necessary if your sendmail prog can't insert one itself. Default "No"
RandomSigs	Whether to generate a new signature automatically. Default "No"
SigDashes	Whether to insert a "-- " line before your signature in a message. Default "Yes"
ShowSigs	Whether to show signatures when displaying messages. Default "Yes"
ShowDeleted	Whether to display items which are marked as deleted. Default "No"
SkipDeleted	Whether to skip over deleted items when using next/prev. Default "Yes"
ReloadOnResize	Whether to reload a displayed message when the message window is resized. Default "No"
PubScreen	Whether to open on a public screen (default or specified). If "No", ADMail will open its own screen, which will clone the WB screen's dimensions, and have 2 bitplanes (4 colours). Otherwise, ADMail will examine the PubScreenName setting to determine what action to take. Default "Yes"
ShowButtons	Whether to show the button bar at the bottom of the list window. Default "No"

1.9 Window sizing and placement

These settings control the size and position of ADMail's windows. As ADMail uses a font-sensitive interface, the exact size of the default windows will depend on the dimensions of the selected system font.

The default settings are such that, using Topaz 8, the message list and message display windows will cover the entirety of a med-red PAL screen (640 by 256). The select window will open on top of the list window.

MsgListLeft	Sizing and placement settings for the message list window.
MsgListTop	
MsgListWidth	Defaults: Under Topaz 8, around 640 by 110.
MsgListHeight	
MsgLeft	Sizing and placement settings for the message window.
MsgTop	
MsgWidth	Defaults: Again, Under Topaz 8, around 640 by 140.
MsgHeight	
SelectLeft	Sizing and placement settings for the mbox select list.
SelectTop	
SelectWidth	Defaults: Under Topaz 8, about 320 by 110.
SelectHeight	
TextWidth	The no. of columns of text to display. Replaces MsgWidth and MsgListWidth. If this option is present, the MsgWidth and MsgListWidth options will not be used. My preferred setting for this is 82. Default: None. The default window sizes are used instead.

1.10 Internal variables

A number of the configuration options may use the internal variables, which ADMail maintains.

\$MSG	Filename of temp. message file (only useable by Sendmail)
\$USER	Your user id (e.g. "simes")
\$FIRSTNAME	First name of sender of current message (e.g. "Simon")
\$INITIALS	Initials of sender of current message (e.g. "SB")
\$NAME	Full name of sender of current message (e.g. "Simon Brown")
\$ADDRESS	E-Mail address of sender of current message, which may or may not contain a realname string (e.g. "Simon Brown <simes@amdev.demon.co.uk>")
\$DATE	Datestamp of current message (e.g. "Sun, 30 Apr 95")
\$TIME	Time of current message (e.g. "13:42:52")
\$MSGID	Message-ID of current message
\$SUBJECT	Subject of current message

Note that most of these are dependent on there being a message currently selected - if there is not a message selected, they will not be parsed.

1.11 Using the mailer

When ADMail is run, it attempts to find the user's alias file and mailbox. It will load the aliases, then scan the mailbox to obtain message information. It will then display this information in the message list window. The display will look something like this:

From	Subject	Status	Lines
Matthew Collins	ADMAIL	A	20
Simon Brown	Talking to myself again...	N	9
Dan Cannon	Re: ADMail	L A	20
John Brown	Re: Hello.	AF	22

The first unread message, if there is one, will be highlighted.

Most of these fields are fairly self-explanatory. The Status field shows a number of letters indicating flags set on particular messages. The flag letters, and their meanings, are as follows:

- N: New message
- O: Old (unread) message
- A: Message which has been replied to
- F: Message which has been forwarded
- L: Message which has been logged (saved or printed)
- D: Message which is marked for deletion (removed when the mailbox is next updated)
- C: Message which has been marked for copying to the received file (this occurs when the mailbox is next updated)
- T: Message which has been marked for transferral to the received file. This happens when the message is marked for both copying and deletion.

To select a message as the "active" one, use the left/right arrow keys to change the highlighted message, or click on the desired message in the list. Actions (delete, undelete, reply, save etc.) may now be performed on this message.

To read a message, either double-click on the desired message in the list, or select the desired message as above and press the Return key. Additionally, if a message is selected, the next one in the list may be read by pressing the > key. Similarly, the one before it in the list may be read with the < key.

If ADMail recognises the message as one it can display, the message view window will be opened and the message displayed within it. Once displayed, the message can be scrolled with the up/down arrow keys, or moved a page at a time using a combination of the up/down arrows and the shift key. ADMail recognises MIME messages of type text/plain, with "7bit", "8bit", "binary", or "quoted-printable" encoding. It also recognises the "us-ascii" and the 9 "ISO-8859" charsets, although it will not convert them. It does not, however, currently recognise multipart messages of any type.

If ADMail does not recognise the message type, it will attempt to run Metamail to display the MIME message. If Metamail is installed correctly on your system, the contents of the message should be displayed by

Metamail, and control returned to ADMail once Metamail has finished. If you do not have Metamail and wish to prevent ADMail from attempting to run it, setting the environment variable NOMETAMAIL will achieve this.

To view a different mailbox, select "Change...". You will be shown the available mailboxes and their sizes. To select a mailbox, double-click on it, or use the up/down arrow keys and Return. The selected mailbox will be opened and displayed as before.

1.12 Menus and shortcuts

This section gives the menu options and available keyboard shortcuts. All of the menu options may also be used on the button bank (see Configuration).

A-<key> indicates the menu (right Amiga) key.

Menu item	Function	Shortcut key
Project		
Change...	Change mailbox	C or A-M
Rescan Current	Reload contents of current mailbox/newsgroup	A-R
Preferences...	Program preferences Due for improvement (currently loads your config file into a text editor)	
About...	Standard About box, with a button for mailing bug reports.	A-?
Quit	Exits ADMail.	A-Q
Message		
View	View current message	V or Return
Next	Select next message from list and view it	>
Previous	Select previous message from list and view it	<
Save	Save current message to new file	S
Print	Send current message to printer	
Decode	Save current message and UUDecode it	
To Received	Mark message for copying to the received file	T
Delete	Mark current message for deletion	D
Undelete	Unmark message marked for deletion	U
Mail		
Send new	Compose and send new mail	M
Reply	Compose and send reply	R

	to current message	
Forward	Forward current message	F
	to new recipient	

1.13 The alias list

The alias list is stored in the home directory of the current user (\$BASEDIR/<user>) under the filename "Aliases". If there are valid aliases in this file, then the alias list window will pop up whenever you try and send new or forwarded mail.

To send mail to someone in the list, double-click on their name, or use the up/down arrow keys to highlight a name and Return to select it. If you want to send mail to someone not in the alias list, select "<someone else>". If you decide not to send any after all, click the close box or hit Escape.

If the list is not cancelled, the text editor will now open up with the message as usual, but if a name was selected the To: field will be filled in with the address for that person.

The aliases are stored one per line in the file. Lines beginning with # are taken as comments. For example:

```
Simon Brown: simes@amdev.demon.co.uk
AmDev Mailserver: mailserver@amdev.demon.co.uk
```

The section before the colon will be displayed in the window; the section after will be used as the address.

Note: Lines without colons in them will be ignored. There is, at present, no way of stretching aliases over more than one line. In addition, aliases cannot reference other aliases, and they are only expanded when selected from the list. They will not be expanded after the message is edited.

1.14 Command-line usage

The command template is:

```
ADMail USER/K,MAILBOX/K,CONFIG/K,TO/K,FILE
```

USER specifies the user ID to assume on startup. Determines where the config file is located. If not given, defaults to the USER setting in the environment or in UULib:Config.

e.g. "ADMail USER sporrans" sets the user ID to be sporrans, and opens sporrans's mailbox.

MAILBOX specifies the name of the mailbox to use (without a pathname specifier). If it is not given, it defaults to the same setting as USER.

e.g. "ADMail USER sporrans MAILBOX spanner" sets the user ID to be sporrans,

but opens spanner's mailbox.

CONFIG specifies the name of the config file, if you wish to use a name other than the default "ADMail.config".

TO is used when you wish to send some mail without opening the GUI. If TO is specified, ADMail will open a blank mail message in the editor, and you fill it out and send it off as normal.

e.g. "ADMail TO simes@amdev.demon.co.uk" opens an editor window for sending mail to me.

FILE is used when you wish to send a ready-prepared file - ADMail will not open any windows, it will just add appropriate headers to the file and pass it to Sendmail. If both TO and FILE are specified, the file is sent to the specified recipient. Otherwise it is assumed that the file already contains a valid To: header.

e.g. "ADMail t:message" takes the file t:message, adds appropriate headers, and sends it;

"ADMail TO simes@amdev.demon.co.uk USR:\$USER/ADMail.config" sends your ADMail config file to me.

1.15 Things yet to do

Things that probably should be done to ADMail:

Better MIME decoding - decoding the text parts of multipart messages, in particular.

Sending messages in MIME format - quoted-printable at the very least.

1.16 Bugs in PROG

I've nailed down almost all the bugs I've been told about, so this is a wonderful opportunity for you to find some more.

I've killed one or two since the last release - check the History list for more information.

To mail me a bug report, click on the "I've found a bug, me" button in the About requester.

Be sure and tell me everything relevant about your system - OS version, amount/type of RAM, processor type etc.

If you get any Enforcer hits, note down the hunk/offset of the ones shown as being caused by ADMail, and send that along, too.

I have been told that occasionally, after doing lots and lots of stuff with ADMail, it'll crash when exiting. I think I may have fixed this now, but if anyone still encounters it, drop me a line.

1.17 Acknowledgements

Profuse thanks must go to the following people:

The beta-testers:

Gareth Edwards <config@ultim.demon.co.uk>
Gwynne Reddick <gred@agog.demon.co.uk>
Phil Stewart-Jones <phil@curve.demon.co.uk>
Tez Boyes <tez@pierrot.demon.co.uk>
Jason Doig <jase@pyrotek.demon.co.uk>
Dan Cannon <dan@blender.demon.co.uk>
Raz <raz@mushroom.demon.co.uk>
James Lynn <james@biometry.demon.co.uk>
Andy Tindall <andy@tindall.demon.co.uk>
Matthew Cowen <matthew@mattyc.demon.co.uk>
Simon Dainty <izzy@ancient.demon.co.uk>
and everyone who downloaded beta 3 from ftp.demon.co.uk.

Also thanks to Raz for drawing the NewIcons icon for me.

Additional thanks to Volant Turnpike for providing my Web space, which can be found at "<http://uptown.turnpike.net/S/simes/index.html>".

1.18 About Simon Brown

Born at an early age in the northeast of England, Simon Brown has successfully reached the age of 22 without succumbing to fatal diseases or limb loss. He has just finished struggling through the final year of an honours degree in Computer Science at the University of Teesside, and has big plans for the future. He has moved out of Middlesbrough, which is a good start.

Simon has produced a number of packages under the banner of Amazing Developments, his shareware label. The most notorious of these is probably Gibbereeze, which is available on a number of platforms and is almost totally useless. Other small utilities he has written include Neat, a text file reformatter, and FilePick, a program to pick random filenames.

Simon is approximately six feet tall, and rather too heavy for his own good. This is mainly due to his predeliction for pasta and Battenburg Treats. Although he has been working out lately, so hopefully he now looks somewhat more human-shaped. He has brown hair and eyes, and a permanent air of puzzlement at the world. He likes to drink tea, and vodka with fresh orange when someone else is buying. If the person buying is particularly well off, he'll have a large Bailey's, please.

The Amazing Developments contact address is:

Simon Brown
28 Broadacres
Bardon Mill
HEXHAM
Northumberland
NE47 7EF

England.
