To install or demo simply double click on the button below. You will be given a choice to demonstrate the macro, install the macro globally (default) or install to a specified template:

{Install/Demo}

## GetAddress

### Purpose

This macro prompts you for a name, then searches through your Person Category in Current, presents you with a listbox if there were more than one hit, then presents a dialog box of the results.

You can then insert the address into the current document.

Optionally, if you have changed any of the fields, you can send the new information back to Current.

If you change the name field and then Update Current, the macro will add a new item to the address book.

### ~~Current Address book format~~

In order for this macro to work as is, your Current address book must have the following format:

Category Name:

Fields within Person:

#### **Name**

Name with *Lastname, Firstname* format

#### **Company**

Company name

#### **Street 1**

**Street 2**

**City**

**State**

**Zip**

**Home**

**Work**

### **Modifications**

The macro can be easily modified to accomodate other fields.

### **AutoLoading:**

If Current is not loaded when the macro is invoked, it will load Current. This assumes that CURRENT.EXE is on the path.

### **~~Additions to this versions (a)~~**

Added the ability to dial the phone directly from Word for Windows.

Added the ability to edit a new item if no match is found.

Fixed a couple of bugs. Thanks to Brian Stine for finding them.

## Future enhancements

There is some thought of adding the ability to print an envelope on a Laserjet printer directly from the dialog box.

## Registration
