

- The continue option is not supported when multiple folders are used. This feature is for single folder use only.
- The random option will only select a file randomly from the primary folder.

Screen Savers

- Sorry Screen Gear doesn't support multiple monitors at this time. Look for this support in the future.
- Don't use Screen Gear while another screen saver is active. Using any screen saver while using Screen Gear as a screen saver may cause unpredictable results, or predictable depending on how you look at it. An example might be as follows: you are doing a presentation using Screen Gear and you have another screen saver running in the background set to become active in 5 minutes. Now lets also assume your presentation is self running. At around 5 minutes after you start the presentation the other screen saver becomes active and blows the presentation. Oops we wouldn't want that!
- Having Screen Gear set to sleep too early, or not moving your mouse to a non-sleep corner before you do a task such as downloading from the Internet, may cause Screen Gear to sleep when you don't want it to. Make adjustments accordingly.
- When an Apple language kit such as JLK, KLK, CLK is installed and you want to use keyboard navigation during a slide show, make sure before you start, you select "U.S." language from the menu. Otherwise you might not get the desired results from your keyboard.
- If you try to view a (PICT, JPEG, MOOV or listen to an AIFF or MOOV) file that was created on anything other than a Mac you might not be able to use the file. The reason is that the other platforms don't use resource information and Screen Gear relies on this information to identify the file types. If you would like to view these files you will need to use ResEdit to open a resource fork and type in the file type. Or you can open the file with your favorite Mac graphic, movie or sound editor and resave the file.

Other Programs

- Screen Gear is not compatible with RAM Doubler™ if Apple's hard disk driver is installed. This incompatibility only happens when Screen Gear is playing AIFF

sound files. Third party hard disk drivers seem to work fine. The system's built-in virtual memory works fine as well.

- Screen Gear is not compatible with GoMac's keyboard commands while Screen Gear is running in the presentation mode. Make sure to wake up Screen Gear if you want to use GoMac's features.
