DDESHR is a Visual Basic implementation of the Windows for Workgroup DDEShare application. Its intent is to provide an example of utilizing several of the API functions used in controlling the DDEShares database. By examining the VB source code, a programmer should be able to determine how to create DDEShare entries from any application. This can be particularly useful when distributing applications that may rely on NetDDE or when the nature of the application makes dynamic DDEShare entries necessary.

Several of the API functions cannot be called directly from VB. A DLL has been provided (DDESH.DLL) to act as a filter between VB and the API. C source code for the DLL is also provided.

Any comments or suggestions regarding this application are welcome.

THIS DEMONSTRATION APPLICATION IS PROVIDED FREE OF CHARGE. THE RECIPIENT MUST DECIDE FOR THEMSELVES ITS USEFULNESS FOR ANY PARTICULAR APPLICATION.
