

## CodePrint™ - Revision History

This file contains enhancements and bug fix history for CodePrint.

### VERSION 2.10 April 30, 1993

#### Bug Fixes

- Fixed bug that would occasionally spool a job to Print Manager but not print. It appears to occur only for jobs that require less than one sheet.
- Changed the FONT dialog to always display with a gray background to be consistent with the other dialogs.
- Not sure this is a bug as much as it was an omission. When duplex printing was implemented, it was not implemented for use with the DRAG-AND-DROP feature. It is now, along with some other convenience features.
- Fixed bug that did not gray the header or footer edit control if unchecked.

#### Enhancements

- You can now DRAG-AND-DROP files while CodePrint is MINIMIZED with the duplex option ON and it works. You will get the normal message about turning over the sheets and placing them back in the printer after the first printing pass is complete, just like RESTORED mode operation. However, to complete pass 2 printing, click the CodePrint icon to display the Control/System Menu. Then select Print Pass 2 to complete duplex printing for the dropped file(s). To cancel pass 2, select Cancel Pass 2. You can also toggle Duplex Printing mode from the Control Menu.

Other selections include changing the configuration and displaying the information dialog.

If you normally use CodePrint in the DRAG-AND-DROP mode you can now perform most task without restoring the application.

**Note:** When pass 2 is pending the printer light on the icon (right side of printer) changes from BLACK to RED. After selecting Print Pass 2 or Cancel Pass 2 it changes back to BLACK.

- This leads to the other important new feature. The ability to run multiple copies of CodePrint has been re-implemented. For the users who actually read these files you will notice that this feature was disabled in v1.16. This feature needed to be tested and now appears to work very well.

You can now open several copies of CodePrint, each with a different configuration and DROP files to the icon with the configuration you want to use.

- Added the option to print the default wrap symbol '==>', or not print it. If this option is checked, which will print the wrap symbol, you can also change the symbol you want to use for wrapped lines. This feature is accessed from the Page Layout dialog.
- Added a third border option which will print only a divider between columns. This feature is accessed from the Page Layout dialog.

## VERSION 2.02 March 5, 1993

### Bug Fix

- Fixed bug that caused erratic program behavior when using a long header or footer.

## VERSION 2.01 February 8, 1993

- Code maintenance.

## VERSION 2.00 January 25, 1993

### Enhancements

- Added Duplex Printing option to the Options menu item. When this option is checked, duplex printing is enabled. If this option is unchecked, the default, duplex printing is disabled.

Duplex printing allows you to print on both sides of the paper. Duplex printing requires two passes. You first select the files you want to print and choose the Print File(s) button. After the files are sent to the printer or Print Manager, the following message is displayed.

```
When printing is complete, turn sheets over and re-insert in printer so the
blank-side of the first sheet is on the top. Then choose the Print File(s)
button again.
```

Press OK. You will notice that the files are still listed in the Print listbox. Next, after all the sheets are ejected from the printer, re-insert them in the printer and choose the Print File(s) button to print on the back of the sheets, which completes duplex printing.

Due to the variety of printers on the market, you may have to experiment with the order the sheets are output from the printer and the order and orientation required when placed back in the input tray. Therefore it is suggested that you print only one file with multiple sheets for test purposes. (See On-Line help for more detailed information).

**NOTE:** Due to the way duplex printing is implemented you should not enable it when printing to a network printer.

### Bug Fixes

- Fixed bug that would not allow further printing if a print job was cancelled.
- Improved the keyboard interface for the main dialog window so now the TAB key will always move between the controls even if CodePrint loses focus due to switching applications.
- Fixed bug that would not prompt to save changes during Exit when changes were made to the Options menu.

## VERSION 1.17 December 31, 1992

### Bug Fixes

- ☐ Fixed bug that would lockup CodePrint when a file was missing a Ctrl-Z EOF marker.

## VERSION 1.16 November 30, 1992

### Changes

- ☐ Only one instance of CodePrint can be run. If CodePrint is started when a previous instance is already running, the first instance of CodePrint will move in front of any other applications.

### Enhancements

- ☐ Changed File menu to have a Save and Save As option. The Save option and the Save button on the toolbar will save the current configuration. The Save As option will display the Save As dialog. You can save the configuration using the same name or a new name.

- ☐ Added option to display page summary information for the currently selected configuration. Select **Page:Info...** option from the menu to display the "Page Information Summary" dialog. The dialog displays information not displayed in the toolbar or status sections of the main window.

New information added for this release includes the number of characters per line and the number of lines per page for the current page format. Other information displayed includes the status of application options and current margin settings.

- ☐ Code maintenance.

## VERSION 1.15 August 31, 1992

### Bug Fixes

- ☐ Fixed bug that would not find the REGORDER.FRM file if the Working Directory was not the same as the Command Line or start-up directory. This file must be in the same directory as the CODEPRNT.EXE to print it from the registration dialog.

## VERSION 1.14 July 31, 1992

### Enhancements

- ☐ Added option to print line numbers. Select **Page:Layout** option from the menu or press the Page button on the Toolbar to access the Page Layout dialog. With the Line Numbers option checked, line numbers are printed at the left margin for each line. If you do not want to include line numbers, you should uncheck this option. This option is saved with each

configuration.

## **VERSION 1.13 July 20, 1992**

### **Bug Fixes**

- Fixed bug that would not update the file list under certain instances when opening a configuration.

## **VERSION 1.12 July 09, 1992**

### **Enhancements**

- Added Ignore Form Feed option to the Options menu item. When this option is checked, form feed characters are ignored. If this option is unchecked (default), form feed characters are recognized and will start a new page.

*Note: Form Feed characters must be column 1.*

### **Bug Fixes**

- Previous versions ignored FORM FEED characters. Version 1.12 corrects this problem.

## **VERSION 1.11 July 02, 1992**

### **Enhancements**

- Added Options menu item to main menu bar. The submenu option is the Use Path command. When this option is checked, CodePrint will use the PATH and FILE SPEC saved with the current configuration as the working directory during startup and when a saved configuration is opened. If this option is not checked, CodePrint will use the default working directory, as listed in the Program Managers "Program Item Properties" dialog for the CodePrint icon item, during startup and when a saved configuration is opened.

- Added Truncate option to the Options menu. When this option is checked, all lines are truncated if wider than the page. If this option is unchecked (default), all lines wider than the page will wrap to the next line.

### **Bug Fixes**

- Fixed problem that would not blank out the SIZE and MODIFIED status fields when opening a saved configuration.
- Added message to save current configuration before program exit, if it was modified.

## **VERSION 1.10 June 24, 1992**

### **IMPORTANT**

Due to the addition of FULL margin support, configurations saved with v1.00 will not read the correct information for the PAGE dialog. To correct this problem you can delete the CodePrint.INI file or open each saved configuration and change each option.

## **Enhancements**

- Added FULL support for margins. You can now adjust the left, top, right and bottom margins individually. This feature corrects the problem with Dot Matrix printers that would push the right or bottom margin off the page depending on the current orientation. This new feature can be found on the Page Layout dialog.
- Added the ability for the user to change the number of spaces used to expand tabs. The default value is 8. A value of 0 essentially removes tabs.

## **Bug Fixes**

- Fixed bug that would not change to the saved path and file spec when a new configuration was opened.
- Fixed bug that allowed a none wildcard file spec to be saved with a configuration.
- Corrected bug that would save the window position when application was closed from iconic state.

## **VERSION 1.00 June 16, 1992**

Initial release.
