

FExtend for Windows 3.1 File Manager

(c)1992 Babarsoft, Inc. Written by Mark Gamber
Version 1.6

FExtend works in conjunction with the Windows 3.1 (or better) File Manager, providing drag-drop methods of deleting files, getting information on files, time/date stamping files and changing file attributes. It made be configured to automatically load selected "applets" along with File Manager. In addition, selected applets may be configured in various ways, including screen position and whether or not they "float" above all other windows at all times.

To begin using FExtend, uncompress **FEXTND16** to a floppy disk for safety and, if not already running Windows, start Windows and run the included program **FINSTALL.EXE** by double clicking on the file from the File Manager or from the Program Manager's "Run" item in the "File" menu. Finstall will copy the files to your Windows directory and add the required data to the File Manager to let FExtend run. If you are running File Manager when you run Finstall, you will need to close and reopen File Manager since the application loads with File Manager. Online help is displayed automatically the first time FExtend is run. After than, you may get help from the "FExtend" menu.

Custom setups are easy. You may copy FEXTEND.DLL and FEXTEND.HLP to any directory on any disk as long as you tell File Manager where to find it. I wouldn't recommend using a floppy disk but just about anything else is ok. When you've placed the files where you want them, it's simply a matter of making sure the following lines are in **WINFILE.INI**:

[AddOns]

FExtend=<your disk and pathname>FEXTEND.DLL

Add these lines, if not already there and correct and save the file and you're ready to go!

Finally:
