

# HOW TO MAKE CHEMICAL WEAPONS

By: The Hacksaw

Name: Sarin

Type: Nerve Agent

Chemical Name: Methylisopropoxyfluoro-phosphine oxide

Method of Production:

Sarin or GB, can be produced by mixing Isopropyl alcohol, isopropylamine, which, if not

extractable from the alcohol, can most likely be readily obtained at any chemical dealer,

legal or otherwise, an cousin to insecticides, methylphosphonic difluoride. The liquids

should be poured into a container with isopropylamine, and isopropyl alcohol, (or the

mix of the two) first, that the methylphosphonicdifluoride, the bottle capped and thrown

at your target. These substances should UNDER NO CIRCUMSTANCES be mixed at ANY time before

you are ready to use them, unless you are trying to commit suicid, or re REALLY into

masochism. Also, after throwing your bottle/jar, I recommend that you RUN LIKEHELL! hat

gas goes FAR.

Additional notes: This stuff is a very powerful, very effective, and rumor has it that it

is surprisily cost efficient. At one time, the cost of this agent dipped to \$3.00/kg. Holy

shit! Also, this stf is odorless.

Name: Phosgene

Type: Choking Agent

Chemical Name: Carbonyl Chloride

Meathod of Production:

This is a primitive, yet effective, and the easiest chemical agent to produce in the

home. Basically to take a jar, put in some household ammonia, and then some javex,

although make sure the javex is ittle bit less than the ammonia. Then just cap and throw

as mentioned in the above article on Sarin This substance has an odor of newly mown hay.

Name: Hydrogen Cyanide, or Cyanide Gas

Type: Blood Agent

Chemical Name: Hydrogeen Cyanide, Hydrocyanic Acid, or Prussic Acid

Method of Production:

Hydrogen Cyanide or Cyanide gas can be produced simply by spraying or dispersing

Hydrocyanic or Prusc Acid in an aerosol type manner. Also, I have come upon the strategy

of dropping in about three cm shaped rolls of aluminum foil, which, when the acid reacts

with it, should release it's gaseous frm This is theoretical, (I have not yet tested this

theory) so if you do it this way, PLEASE do it n VRY small ammounts and it would be nice

if you would share your results with me. This agent is sad to have an odor of peach

kernels.

Name: Arsine

Type: Blood Agent

Chemical Name: Arsenic Trihydride

Method of Production:

Arsine gas is produced industrially by the action of moisture on Calcium Arsenide. If you

can get some of this from a chemical dealer, place this in a container, and when ready to

use, add water, cap, n launch. I have also come up with the theory of taking plain liquid

arsenic and adding water to it to get the same effect, however this theory too, has not

been tested. Arsine is has an odor of garli.

Name: Mustard Gas

Type: Blistering Agent

Chemical Name: 2,2-Dichloro-Diethyl-Sulphide

Method of Production:

I do not have much information on this substance so, I will improvise. As the name

sugests, I would commend mixing 2 parts Chlorine, (such as javex) with 2 parts ethyl

alcohol, (Booze alcohol, buy Evrlear, or distill it off some other type of booze.) with 1

part powdered sulphur. (Obtainable in th dug store as a laxative. Sold in pure form,

yellow powder. This mixture must the be distilled. (Boil t form steam, then the steam

collected, and recondensed) Ask for precipitated sulphur) This theor, aslike all my other

ones, has not been tested yet, so as before, please experiment in small amounts, and bring

me the results.

Additional notes: The nerve agent I described is effective, but it has a drawback, to

cause death or amage, it must be inhaled. It is known as a "G-Agent". There are more

powerful things called "V-Aget" that one produce, but is near impossible too, and I

challenge anyone to produce it with out gassing hemselves to death. Also, I don't think

you'll get the chemicals that easy. Anyways, the chemical composition for agent "VX" is:

Put a liquid know as "QL" (Chemical name: ehtyl-2-di isoprophylaminetylmehyl) and then

throwing in powdered sulphur, capping, throwing. and leaving the country. Anyways I hoe

to be able to bring you vomiting agents, and tear agents in my next paper. Untill then,

Watch for products of Anarchial Productions Unlimited, and remember, ANARCHY RULES!!!!!!

y, that's it for now! Happy hacking, aÚ-{'
