TPassword and TPasswordBox ver 1.1 for

DELPHI

Copyright Total Data Concept AS 1995 - 1996

Thanks for looking at the TPassword and TPasswordBox components for Delphi.

The TPassword component is a powerful tool for adding passwords to Paradox tables without the need for storing the password externally.

The TPasswordBox component replaces Delphis password-dialog.

A short description of TPassword:

Properties:

- TableName. Identifies the table to protect. Use the dropdown list to find the table.

Methods:

- SetPassword(Password: string): Protects the table with the password.
- ClearPassword: Removes the password protection from the table.

Events:

- BeforeSetPassword
- AfterSetPassword
- BeforeClearPassword
- AfterClearPassword

A short description of TPasswordBox:

Properties:

- NumTries: Sets number of tries you can try to enter the password. Default is 3 tries.

Methods:

- Reset: Resets the number of tries counter back to NumTries. This procedure should be called after each succesful password entry.

A example for both components is included in the password directory.

This demo-component uses the Employee.db from the Delphi examples.

In the demo you should close the table before you add or clear the password.

How to install the components:

1. Create a directory and copy the password.zip into this directory then unzip password.zip
2. Start Delphi
3. Choose Options|Install Component
4. Select Add
5. Add the filename \directory\PWDREG.PAS, where **directory** is the name of the password directory.
6. Select Ok to add the components to the palette

The components are installed on the TDC page.

How to test the demonstration:

1. Start Delphi
2. Choose File|Open Project...
3. Select the password directory
4. Select the project PWDEX.DCR

How to order the components:
