

SmartCat Lite - DOS6 Backup Extension

Description

The SmartCat Lite DOS6 backup extension is designed to enable SmartCat Lite to determine the file names of files that are contained within a DOS6 backup, and to return those filenames to SmartCat Lite such that they appear as "internal files" of the backup file, much like a .ZIP file has internal files. The backup set name etc. is also returned as a comment for the main backup file. Once correctly installed the extension will be called automatically each time SmartCat Lite comes across a file with an all numeric extension. The extension will ignore files with all numeric extensions that it cannot confirm are DOS6 backups. Note also that this extension **may** work with backups produced by the Norton backup product, which use a similar format.

Manual Installation

The DOS6 backup extension should normally be installed automatically, but if you need to perform a manual installation take the following steps:-

Copy the DLL, which is called **SCBKPEXT.DLL** to the same directory as SmartCat Lite.

Edit your **SMARTCAT.INI** file and locate the [Extensions] section, and add the lines

.AllNumbers=SCBKPEXT

(note the dot . at the start, it is required), then save your **SMARTCAT.INI** file.

Note that SmartCat Lite can only have one extension installed at any one time. If more than one extension is coded in the [Extensions] section of the SMARTCAT.INI file then only the first will be used. You can experiment by modifying the order in which the extensions are coded. The professional version, SmartCat Plus, can use multiple extensions.
