Pentium Flaw Detector version 3.01

I wrote this utility (in C) so that when I buy a Pentium (if ever), I know if it has the Pentium flaw or not. Copy 586TEST.EXE to a floppy diskette and bring it with you to the store. Check to see if the Pentium is "flaw-free", by running this 586TEST on the Pentium.

I tested this program on my friend's Pentium and it failed so I'm sure that it works. Any other 80x86 computer will pass the test (you do not need a Pentium to run it; but running it on any other computer does not have much use). It WILL pass the test if the FPU of the Pentium is disabled so make sure that it's enabled before running this utility to see if the Pentium has the flaw or not.

If you already have a Pentium, use this utility to see wheter you have the bug or not.
