# What's New

Version 1.5A(2/19/94)
    -- Corrected GPF when file is not a catalog, file contains no catalog entries, or catalog read canceled by user.

    -- Fixed cursor movement in the Configure|Preferences dialog.

Version 1.5(1/14/94)
    -- Added Mark|Custom for mass marking based on selected criterion.

    -- CatCIS now maintains window state info so it will open maximized if you exit that way.

    -- Adjusted Configure|Directories so only one set of directories must be entered. The other set will be made to mimic the entered set if not entered.

    -- Added append or overwrite option for MSL scripts.

    -- Fixed problem with reading mixed short and long descriptions in GoCIS catalogs. CatCIS now reads the TapCIS and GoCIS catalogs with different logic.

    -- Added 'bookmark'. Next time you open a catalog, you will be placed at the last catalog object at which you were viewing, unless you have updated the catalog, in which case you will be placed at the first new catalog entry.

    -- Added optional feature to automatically open the file open dialog when CatCIS first starts and there is no command line parameter.

    -- Added a relaxed duplicates option to Configure|Preferences. This allows comparison between short and long descriptions by not using the CIS ID of the uploader. In cases where there is both a short and a long description for a given filename, the long description will be retained. The risk in using this option is that the uploader's ID is not used in the comparison. If two files of the same name happen to exist, uploaded by different people, you will lose one of them.

    -- Changed sorts to use last download date as it is more reflective of the entry's age.

    -- Change to insure there is a last download date. If one not available from the catalog, use last update.

    -- Adjusted mark duplicates to better handle CIS ID.

    -- Change to use Julian dates so update routines could calculate number of days.

    -- Fixed error on next session when sorted by dates.

    -- Corrected problem with View Next on Mark preference choice sometimes not clearing the old description from the screen properly.

    -- Corrected problem that could cause GP fault on append if there are a multiple of 50 catalog objects in the current file.

    -- Fixed Append so that if no catalog items were found in the append, the query for write dialog will not appear.

-- Changed Count/MaxCount fields in the status bar to handle 5 digits

-- Update Catalog feature added. Allows update by library based on the latest item in the library, rather than by catalog's latest file date. Provides a mechanism for marking libraries as active/inactive, file mask, keywords, and user may change the number of days for the update.
