COMMON QUESTIONS ABOUT THE FREE KEYBOARD

How am I supposed to remember what all the keys do?
No one can remember what all the keys do. That is why we have the
[Ctrl G] index. In the middle of editing, just press [Ctrl G] to see what
the keys do.

How do I find out all the options and features of each key?
A fuller description of each key is obtainable by pressing the letter of
the key while in the index [Ctrl G]. This gives you a half screen
description of the key. A better way is to press the key and then look at
help. All of the complex keys have help to guide you in picking
options.

Why are some of the WordPerfect macros repeated here?
Many of the WordPerfect macros have been improved to work better
with Reveal Codes [F11] and to have help. CALC has had major
improvements made to it.

Why are the WordPerfect keyboards repeated here?
The WordPerfect keyboards have had the **[Alt K]** key added to make it
easy to switch between keyboards.

Why doesn't the Free Keyboard work for me?
If it has never worked, you probably did not use the Install macro to
install it. Make sure that the location of files [Shift F1]LK is pointing to
the keyboard. Make sure that the macro MACROLOC is in the same
directory as the FREE Keyboard and is pointing (edit it to see} to the
location of the FREE macro library.
If it used to work and has stopped, try these things:
  ● 	Press [Ctrl 6] twice to activate the current keyboard. Pressing it
once deactivates the keyboard
  ● 	Check that the location of files [Shift F1]LK is still pointing to the
Keyboard. System managers sometimes reset this pointer while changing
printer setups.
  ● 	Sign out and try again

What are all these macros ending with _H?
The files ending in _H are help macros that are called by macros of the
same name. Text takes up twice as much space in a macro as in a text
file. This makes commented macros huge. We have therefore moved
the help screens out of macros that were too large already.

How can I edit these large macros? Why are they so big?
I can edit all of them on a 286 with one meg of memory. Do not try it
however, if you are using Document 2. If you don't have enough

memory to edit a macro, try exiting WP and editing as soon as you re-enter. Also try using fewer TSR's. Large macros have been broken down into several parts, but there is a lot of overhead in macros and this has been avoided where possible. SHOW_H is much bigger than WP says a macro can be and still be edited without the macro Editor (from WP Office), which goes to show how powerful WP 5.1 really is.

The WordPerfect keyboards are self contained.
Why do you have all these macros?
The Word Perfect keyboards are not self contained but reference the EDIT, LABEL and other large macros. The maximum size for a keyboard is about 45K and it sits in memory all the time, reducing working space. We {CHAIN} or {NEST} to macros as we use tham. The FREE Keyboard is under 10K and does incorporate some "shortcut" macros that are very short. The macros are also independent to allow you to use the macros individually without the Keyboard or to incorporate them into other keyboards.

Are there any known problems with any of the keys?
Some users have reported that [Alt R] is sometimes not deleting its wide margin code. I have been unable to reproduce the problem or ever have it happen to me. There seems to be no pattern to it and it only happens now and then. This is puzzling since it is one of the simpler macros and is well tested. Your experiences would be appreciated since I can see no patterns of documents or use involved.

10. **How do I get in touch with the author?**
