

MV Communications

MV Communications, is a public-access UNIX(tm) service which provides access to Internet mail, newsgroups, file transfer, and more. If you are not currently a subscriber, you can contact MV directly at 603-429-2223, or send email to info@mv.com.

The Script File which *RFD Mail* uses to interact with MV Communications is the file `mv.scr`. This script downloads and uploads mail using the ZMODEM file transfer protocol, which is very efficient error-correcting protocol. Because it is so efficient, it is recommended that the Flow setting in the Post Office entry for MV Communications be set to **Xon/Xoff** to prevent overrunning either MV Communications or your local computer.

Because your account with MV Communications is highly tailorable, the script file may not work "out of the box" if you have modified your login procedures. If you encounter difficulties with the script, contact rfdmail@world.std.com to get further assistance.

Other Options:

The `mv.scr` file is highly configurable through liberal use of script aliases. For example, if you use a shell other than `/bin/csh` (bash for example), you can easily adjust the script to accomodate your shell's prompt by changing the "prompt" alias. You can also easily select a transfer protocol other than ZMODEM if you are having upload or download difficulties. These and other options are documented within the `mv.scr` file itself.
