

## Stupid Little Clock (SLC) v2.0 by Robert Reinstein

Place the two VBX files, THREED.VBX and CMDIALOG.VBX, into your Windows\System directory.

You may already have these, so make sure that yours are older before you overwrite them. Keep SLC.INI in the same directory as SLC.EXE.

**SLC** displays a small digital clock on any corner of your screen. Click on it once and an options panel will open. From there you can choose to change the background and foreground colors, place the **SLC** in another corner, change your system's clock, keep the SLC as the topmost window, or change the display format. Click on Exit to unload the program, or click on OK to go back to the **SLC**.

Just my little contribution to the freeware world.

Check out the About box for info about my AVI file viewer and capture program, **MultiView**.

All the best.
