

# **FileClip 1.1**

by Ben Sprachman

Simple FreeWare utility written in Borland C++. This program is a useful companion to David Stafford's Launch Utility. It is used for those time when an application expects a path or file name, and does not provide a file system browser. e.g. RUN from Program Manager or changing ICON for Program Manager Program Item.

Use the browser to select file. Double clicking on a file without wildcards will copy its name into the Clipboard. To copy a filename with wildcards to the Clipboard, use the COPY button. Check boxes are provided for copying only the Directory path, or for changing the back slashes "\" to forward slashes "/". This conversion is required for copying path names to a UNIX system.

Version 1.1, stays resident, i.e., when selecting COPY , it minimizes itself. To close FileClip, select CLOSE from the System Menu.

Enjoy
