This template installs three macros:

**InsSingleQuote**

**InsDoubleQuote**

**ToggleSmartQuotes**

After installing you should FileSaveAll to save NORMAL.DOT.

If you have previously installed the SmartQuotes macros that shipped with Word for Windows 2.0 -- that is, those contained in NEWMACRO.DOC -- you can now delete them. They are not used by this group of macros.

Improvements:

- 1) Three macros instead of four
- 2) The menu item is a Toggle that shows a right chevron when smart quotes are on
- 3) There is an editable "exception list" in which you can place the font name for fonts that you \*don't\* want to have smart quotes. By default this list contains generic "fixed fonts":

```
Exception$ = "COURIER, PRESTIGE ELITE, LETTER GOTHIC,  
LINEPRINTER,
```

Changing this to match only your fixed fonts may speed things slightly.

- 4) It uses a new WIN.INI flag named SmartQuotes -- which is set to 1 when SmartQuotes are on, and 0 when SmartQuotes are off.

These macros are FreeWare. They are not encrypted.
