Player for midi- and waveform-files
Version 2.0

First of all, thanks for registrating and so for motivating me to write more usefull shareware applications for Windowsw in the future.

Release note: This is version 2.0 which replaces all earlier versions of CATSPLAY and all the bugs of these programs. You will find a total new design. Be happy with the new style!

This Windows 3.1 application allows you to play all *.mid and *.wav soundfiles on your soundcard.
The usage of the program does not need many explanations. After start up, the "Catsplayer" will show you a listbox with all soundfiles in the directory which you can play at once by dubleclicking them.
You can select any number of soundfiles and let them be played queued. Use SHIFT ore CONTROL keys in combination with the mouse for selecting the sounds, to handle multiple selections. For selecting all soundfiles present in directory by pushin the SELECT ALL button. You can pull the selected into the listbox for queued sounds by holding down both right and left mouse-button or by using the "--->" button.
Start the Soundqueue with the PLAY-button.

The INFO-button shows you an information-window (only for waveform-files), which tells you about sampling-rate, size, duration and A/D-resolution. The information is extracted always from that soundfile whitch has the focus rectangle in the filelistbox.
With large soundfiles creating the information window takes some time, because the soundfile gets reversed while this creation. Play the reversed sound by pushing the REVERSE button in the info dialog.

Play around with all the features and you will find them easy to use.

Christian Abeln, Karlsruhe BRD, 29.3.93
