Chapter 1

SetPatch_43.4

1.1 main

workbench/c/setpatch

```
Patch for mathieeesingbas.library Mul/Div FPU handling.  
Patch for the OS copyright.  
Patch for WritePixelLine8 trashing the source.
```

Make a copy of your old SetPatch before testing the V43 SetPatch.
The V43 SetPatch should work well with any OS \geq V37. Please send
in a short report if it WORKS WELL, too!

The CheckSetPatch.c code fragment may help some software developers
to internally turn off workarounds for OS bugs conditionally.
