OUTPUTS:

a) Hardware
A printed output of the draw map can be obtain by selecting the print option in the main menu (or by pressing command-p key). By default, the map is to be scaled to fit on a   Portrait format paper. To change the default format and scale, see   the section on "Page Layout "   (as described in the last section in the "Tools" topic).

Note: due to the lack of hardware, the application has not been tested with a color laser printer, but according to the output shown by the Previewer application, a color output   should be obtained with color laser printer.

b) Software:
TIFF FORMAT:
As default, this application will save the map (with the exact same size of window) to a specified file by using   the *LZW* compressed *TIFF* format. This can done by selecting the save option in the Document submenu (or by pressing the command-s key). Note that such feature can be used to make movies. The demo of this application was made with a sequence of these tiff images   which themselves were made with this application.

POSTSCRIPT FORMAT:
User can obtain a color postscript output by selecting the print option, but instead of sending the output to a host printer, just send it to a   specified file (i.e. by clicking on the save button in the print panel).
