

# Preferences

**uuMon** currently has two preferences, which deal with how it uses uucp to send files. The toggle between "Use Source File" and "Copy to Spool Directory" specifies whether or not to use the source file when copying out. The default, unlike with the command line version of uucp, is to copy the file to the spool directory. This alleviates the problem of accidentally deleting a file before it is sent to the other system.

The second preference, "Remote Directory", specifies where on the remote system the file should be copied to. It defaults to "~", which expands to /usr/spool/uucppublic on most systems.
