

Hello!

This directory contains an Application directory, a Packages directory, and a Documentation directory. From here, you may:

1. Run this application straight from the CD. To do this, click on the Application directory and then double click on the ParaSheet.app revealed within. You may also look through the Documentation directory for information about how to use ParaSheet.
2. Install this application on your machine for personal or general use. To do this, click on the Packages directory. There, you shall see revealed the package needed to install this application. Merely double click upon it, and use NeXT's Installer.app to unpack this application on your system in the appropriate directory.
If you are installing it for your personal use, you will probably want to set the installation location to your own Apps directory. Otherwise, you

will probably want to log in as root and install it in the default /LocalApps location.
