

## Word For Windows 1.0 - Macros

### WFWEPS 1.2

~~{Install}~~

### ~~WFW Encapsulated Postscript Support~~

Attached to this document are two macros that are adapted from the InsertPicture and FilePrint macros found in the EXAMPLES.DOC. The recent changes made by Microsoft in WEPS.ZIP are also included. WFWEPS 1.2 macros correct the remaining troublesome problems and provide several additional much needed functions. Among these are support for most existing PC and Mac Encapsulated Postscript Formats including those without TIFF or WMF preview (i.e., early Adobe Illustrator and Windows 3.0 postscript driver EPS file output). And EPS support for LandScape mode!

WFWEPS 1.2:

-  
-  
-

User dialog box option (defaults to No)

-

Inserts virtual frame for display

Frame is sized per boundary box specs of the EPS file

The frame can be scaled and positioned by the user

Boundary Box may use relative or absolute coordinates

EPS file may include imbedded Showpage operators

To install the new attached InsertPicture and FilePrint macro just double click on the install button at the beginning of this document. I would suggest saving your NORMAL.DOT template under a different name before doing this as a backup precaution.

If you find these macros to be useful to you and you use them, you must send a \$25 registration fee to the address below. This may encourage me to provide additional enhancements. I will only consider the comments ,suggestions, and problem reports from those that register.

Thanks for your support ,
