PATCH To Ami Professional to remember the Windows Metafile directory:

SYNOPSIS:

As it comes "off the shelf", Ami Professional does not remember the location of the Windows Metafile directory. Each time a Windows Metafile is to be input, the directory must be set by the user.

After some experimentation, I have determined a change to WIN.INI that will make Ami Professional locate the Windows Metafile directory.

CAVEAT:

This patch works with at least my version (1.2B with AMIPAINT.DLL patch from Samna) of Ami Professional. I am not responsible for anything that happens if you try this patch and something happens! (This patch did not come from Samna.)

APPLYING THE PATCH:

Add the following line to the "[AmiPro]" section of the WIN.INI file:

application37=Win Meta File,D,.WMF,0,c:\ap\meta

(The text "c:\ap\meta" is the initial default directory for the Windows Metafiles.)

Save the WIN.INI file.

Exit Ami Professional (if running).

USING THE PATCH:

Start Ami Professional in the normal manner.

When selecting Windows files for import, use the "Win Meta File" entry, not the "Windows Metafile" entry.
