## TIPS & TECHNIQUES

# Have Modem, Will Download

It's what you asked for: Fast access to up-to-date NEXTSTEP technical information through the NeXTanswers bulletin board service (BBS). NeXTanswers is an automated information retrieval system, containing information on system configuration, answers to common questions, past articles from *NEXTSTEP In Focus*, and much more. The new BBS allows you to download NeXTanswers quickly and easily.

### How to use the BBS

To use the BBS, you need a modem that fits these specifications:

- **Speed** 300±14400 bps (v32.bis) and ZyXEL 19200
- **Compression** MNP5 and v42.bis
- **Transfer protocol** X, Y, or Z modem

To download a NeXTanswer from the BBS, follow these steps:

1 Call the BBS at +1 (415) 780-2965.

2 At the prompt, log in as the user **guest**. You don't need to enter a password:

```
Enter login, "guest" to download files, ? for help: guest
```

3 After the BBS greets you, it asks for your name and your company's name. We use this information to track usage of

NeXTanswers.

- 4 The BBS displays a menu of options. To download NeXTanswers documents, type **Files** and follow the instructions.
- 5 In addition to downloading files, you can search NeXTanswers for keywords you select, and perform other operations. Type **Help** or **?** to get information.
- 6 When you've finished using the BBS, type **Bye** to exit.

If your company has a support contract with NeXT and you are a registered contact person, you can open an account in the NeXTanswers BBS. This account lets you exchange e-mail with NeXT's Support group. To open an account, log in as **guest** and select the **Apply** command from the main menu. If your account is approved, it will be opened in a few days.

### Other ways to get NeXTanswers

In addition to using the BBS, you can still get NeXTanswers through e-mail, anonymous **ftp**, and automatic fax.

- **E-mail: NeXTanswers@next.com**
- **ftp: ftp.next.com**
- **Fax: (415) 780-3990 (U.S. only)**

If you have trouble, please send e-mail to **NeXTanswers-request@next.com**.

## Compressing Files You Plan to Mail

When you're sending a file via e-mail, don't compress it first. Ironically, compressing the file makes the message that is transmitted larger. The reason is that e-mail automatically compresses messages before transmitting them. Compressing an already-compressed file makes it larger.

# Displaying Hidden UNIX Files

Hidden backups of files can take significant space without anyone knowing.

Many applications can automatically generate backups of files. This is useful because you can use these backups to retrieve the previous version of the file if you accidentally destroy something in the current version. Most applications use the convention of appending a tilde (~) to the file name to create the backup file. Most only keep the most recent backup, overwriting it each successive time you save.

As useful as these backup files are, though, if users don't know they're there and therefore don't delete the files when they're no longer needed, the backups can take up a significant amount of disk space unnecessarily.

In particular, files with ~ at the end of their names don't show up in the File Viewer or in the Save and Open panels when the Workspace's UNIX Expert preference is turned off. Figure 4 shows the effect of turning on this preference. (Other UNIX files become visible as well, particularly in one's home directory.) So, users who have turned off the preference don't see the ~ backups.

Detail\_browser.tiff ↵

*When the UNIX Expert preference is turned off, only the most current version of a file is visible in the File Viewer.*

Detail\_browser\_expert.tiff ↵

*When the UNIX Expert preference is turned on, ~files are visible.*

**Figure 4:** Backup files could be hidden from some users

Many users may not want to have this expert preference turned on all the time. However, you might want to recommend that they turn it on temporarily now and then to clear out extra backup files that could be taking up valuable disk space. And if those users aren't aware that backup files are being saved, they might be happy to learn how to get at those backups!

# SoftPC Correction

In our article about SoftPC in the Winter 1994 issue, we made an error regarding TCP/IP support. Insignia's SoftPC doesn't support TCP/IP via the ODI interface. Instead, it uses a TSR program that implements the Novell LAN Workplace API. As a result, SoftPC supports only applications that adhere to the LAN Workplace API, and not PCTCP or PCNFS applications.

Sorry for the error.
